United States Department of Agriculture

Natural Resources Conservation Service

In cooperation with Spokane County Conservation District and Washington State University, Agricultural Research Center

Soil Survey of Spokane County, Washington

How To Use This Soil Survey

General Soil Map

The general soil map, which is a color map, shows the survey area divided into groups of associated soils called general soil map units. This map is useful in planning the use and management of large areas.

To find information about your area of interest, locate that area on the map, identify the name of the map unit in the area on the color-coded map legend, then refer to the section **General Soil Map Units** for a general description of the soils in your area.

Detailed Soil Maps

The detailed soil maps can be useful in planning the use and management of small areas. They are available from the Web Soil Survey site (http://websoilsurvey.nrcs.usda.gov/app/).

To find information about your area of interest, go to Web Soil Survey, click on "Help," and follow the four basic steps. Note the map unit symbols that are in that area. Turn to the **Contents**, which lists the map units by symbol and name and shows the page where each map unit is described.

The **Contents** shows which table has data on a specific land use for each detailed soil map unit. Also see the **Contents** for sections of this publication that may address your specific needs.

National Cooperative Soil Survey

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (formerly the Soil Conservation Service) has leadership for the Federal part of the National Cooperative Soil Survey. This survey was made cooperatively by the Natural Resources Conservation Service and the Spokane County Conservation District and Washington State University, Agricultural Research Center. The survey is part of the technical assistance furnished to the Spokane County Conservation District.

Major fieldwork for this soil survey was completed in 2010. Soil names and descriptions were approved in 2012. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 2012. The detailed soil maps and the most current official data for this survey are available from the Web Soil Survey site (http://websoilsurvey.nrcs.usda.gov/app/)

Nondiscrimination Statement

In accordance with Federal civil rights law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, the USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family/parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Persons with disabilities who require alternative means of communication for program information (e.g., Braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or USDA's TARGET Center at (202) 720-2600 (voice and TTY) or contact USDA through the Federal Relay Service at (800) 877-8339. Additionally, program information may be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD-3027, found online at http://www.ascr.usda.gov/complaint_filing_cust.html and at any USDA office or write a letter addressed to USDA and provide in the letter all of the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by:

(1) mail: U.S. Department of Agriculture
Office of the Assistant Secretary for Civil Rights
1400 Independence Avenue, SW
Washington, D.C. 20250-9410;

(2) fax: (202) 690-7442; or

(3) email: program.intake@usda.gov.

USDA is an equal opportunity provider, employer, and lender.

Foreword

Soil surveys contain information that affects land use planning in survey areas. They include predictions of soil behavior for selected land uses. Farmers, ranchers, foresters, and agronomists can use the surveys to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the surveys to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the surveys to help them understand, protect, and enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. The information in this report is intended to identify soil properties that are used in making various land use or land treatment decisions. Statements made in this report are intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://soils.usda.gov/sqi/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (http://offices.sc.egov.usda.gov/locator/app) or your NRCS State soil scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. The location of each map unit is shown on the detailed soil maps. Each soil in the survey area is described, and information on specific uses is given. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

Climate 2
How This Survey Was Made 2
General Soil Map Units 5
Soils on Foothills and Mountains 5
1. Bouldercreek-Jacot-Boulderjud (igneous and metamorphic parent material; frigid/udic soil climate regime) 5
2. Lenz-Spokane-Kramerhill-Rock outcrop (igneous and metamorphic parent material; mesic/xeric soil climate regime) 6
3. Ardenvoir-Tekoa-Lotuspoint (metasedimentary parent material; frigid, mesic/xeric soil climate regime) 7
Loessal Soils on Basalt Plateaus 7
4. Naff-Garfield-Thatuna (loess parent material; mesic/xeric soil climate regime) 7
5. Athena-Broadax-Reardan (loess parent material; mesic/xeric soil climate regime) 8
Soils on Channeled Scablands and Basalt Plateaus 9
6. Rockly-Northstar-Rock outcrop-Cocolalla (basalt and volcanic ash parent material; mesic/xeric and aquic soil climate regime) 9
7. Cheney-Alecanyon-Phoebe-Stutler (outwash parent material; mesic/xeric soil climate regime) 10
8. Brincken-Lakespring-Seaboldt (glaciofluvial and loess parent material; mesic/xeric soil climate regime) 10
Soils on and adjacent to Basalt Canyons, Escarpments, and Plateaus 11
9. Marble-Springdale-Spens (sandy outwash parent material; mesic/xeric soil climate regime) 11
10. Klickson-Speigle-Xerolls, mass wasted-Rock outcrop (basalt parent material; frigid, mesic/xeric soil climate regime) 12
Glaciofluvial Soils in Broad Valleys 13
11. Kaniksu-Torboy-Stapaloop-Scrabblers (sandy and loamy outwash parent material; frigid/xeric soil climate regime) 13
12. Urban land-Opportunity-Marble, disturbed (outwash parent material; mesic/xeric soil climate regime) 13
13. Green Bluff-Cedonia-Hunters (glaciolacustrine parent material; frigid, mesic/xeric soil climate regime) 14
Detailed Soil Map Units 17
1001—Bridgeson ashy silt loam, 0 to 3 percent slopes 18
1010—Caldwell-Thatuna complex, 0 to 8 percent slopes 20
1015—Caldwell silt loam, 0 to 3 percent slopes 22
1020—Cocolalla ashy silt loam, 0 to 3 percent slopes 23
1021—Cocolalla-Hardesty complex, 0 to 3 percent slopes 25
1030—Emdent ashy silt loam, 0 to 3 percent slopes 27

1040—Hardesty ashy silt loam, 0 to 3 percent slopes 29
1050—Hoodoo-Kronquist complex, 0 to 3 percent slopes 30
1070—Mondovi silt loam, 0 to 8 percent slopes 32
1080—Narcisse silt loam, 0 to 3 percent slopes 34
1081—Narcisse silt loam, 3 to 8 percent slopes 35
1090—Peone-Saltese complex, 0 to 3 percent slopes 36
1091—Peone ashy silt loam, drained, 0 to 3 percent slopes 39
1092—Hoodoo ashy silt loam, 0 to 3 percent slopes 40
1120—Lovell ashy silt loam, 0 to 3 percent slopes 42
1130—Colburn ashy loam, 0 to 3 percent slopes 44
1200—Endoaquolls and Fluvaquents, 0 to 3 percent slopes 45
1203—Haploxerolls ashy silt loam, channeled, 0 to 8 percent slopes 47
1300—Aquepts ashy loam, frigid, 0 to 3 percent slopes 48
2040—Klickson gravelly ashy silt loam, mass wasted, 15 to 30 percent slopes 50
2041—Klickson gravelly ashy silt loam, 30 to 60 percent slopes 52
2042—Rock outcrop-Klickson-Speigle complex, 60 to 80 percent slopes 54
2043—Klickson-Speigle complex, mass wasted, 15 to 30 percent slopes 56
2044—Klickson-Speigle complex, 30 to 60 percent slopes 58
2045—Marble-Speigle complex, mass wasted, 8 to 30 percent slopes 60
2046—Klickson-Speigle-Rock outcrop complex, 30 to 60 percent slopes 62
2050—Speigle cobbly ashy loam, 15 to 30 percent slopes 64
2051—Speigle cobbly ashy loam, 30 to 60 percent slopes 66
2052—Brincken, moist-Speigle complex, mass wasted, 8 to 25 percent slopes 67
2053—Speigle-Rock outcrop complex, 15 to 30 percent slopes 69
2054—Speigle-Rubble land-Rock outcrop complex, 30 to 90 percent slopes 71
2070—Bobbitt-Lacy complex, 0 to 8 percent slopes 73
2071—Bobbitt-Speigle complex, 8 to 25 percent slopes 75
2080—Gibbs ashy silt loam, 0 to 8 percent slopes 77
2081—Gibbs ashy silt loam, 8 to 15 percent slopes 78
2085—Tucannon ashy silt loam, 0 to 8 percent slopes 80
2090—Rockly-Tucannon complex, 15 to 35 percent slopes 81
2160—Scoap-Rubble land-Rock outcrop complex, 30 to 90 percent slopes 83
3010—Alecanyon cobbly ashy coarse sandy loam, 15 to 40 percent slopes, very stony surface 85
3015—Seaboldt ashy loam, dry, 0 to 8 percent slopes 86
3020—Bong ashy sandy loam, 0 to 8 percent slopes 87
3022—Bong ashy sandy loam, moist, 0 to 8 percent slopes 89
3024—Phoebe-Bong, moist, complex, 0 to 8 percent slopes 90
3025—Bong ashy sandy loam, moist, 15 to 30 percent slopes 92
3026—Phoebe, dry-Bong complex, 0 to 8 percent slopes 93
3030—Bonner ashy fine sandy loam, 0 to 8 percent slopes 95
3031—Bonner-Wapal complex, 8 to 15 percent slopes 96
3039—Alecanyon-Rockly complex, 0 to 15 percent slopes 98
3040—Cheney-Alecanyon complex, 0 to 8 percent slopes 101
3041—Alecanyon, very stony-Cheney complex, 0 to 8 percent slopes 103
3042—Alecanyon, very stony-Cheney complex, 8 to 15 percent slopes 105
3044—Cheney ashy silt loam, 0 to 8 percent slopes 107
3045—Rockly-Deno complex, 0 to 15 percent slopes 108
3046—Cheney-Seaboldt, dry, complex, 0 to 8 percent slopes 111
3047—Rockly-Rock outcrop-Deno complex, 0 to 15 percent slopes 113
3048—Rockly-Hardesty complex, 0 to 15 percent slopes 115
3049—Rockly-Rock outcrop-Cocolalla complex, 0 to 15 percent slopes 117
3054—Clayton ashy fine sandy loam, 0 to 8 percent slopes 119
3055—Clayton-Hagen complex, 8 to 25 percent slopes 121

3056—Hagen ashy sandy loam, 0 to 3 percent slopes....122
3057—Hagen ashy sandy loam, 3 to 8 percent slopes....124
3060—Dearyton ashy silt loam, 0 to 8 percent slopes....125
3061—Dearyton ashy silt loam, 8 to 15 percent slopes....127
3062—Dearyton ashy silt loam, 15 to 30 percent slopes....129
3070—Eloika ashy very fine sandy loam, 0 to 8 percent slopes....131
3071—Stien ashy silt loam, 0 to 8 percent slopes, very stony....132
3072—Stien ashy silt loam, 8 to 15 percent slopes, very stony....134
3073—Stien, very stony-Rock outcrop complex, 15 to 30 percent slopes....135
3074—Eloika ashy very fine sandy loam, moist, 0 to 8 percent slopes....137
3080—Opportunity very gravelly ashy loam, 0 to 3 percent slopes....138
3081—Opportunity very gravelly ashy loam, 3 to 8 percent slopes....140
3082—Opportunity very gravelly ashy loam, 8 to 15 percent slopes....142
3083—Garrison very gravelly ashy loam, 0 to 8 percent slopes....143
3084—Garrison very gravelly ashy loam, 8 to 15 percent slopes....145
3085—Garrison very gravelly ashy loam, 15 to 30 percent slopes....146
3087—Garrison very gravelly ashy loam, 0 to 8 percent slopes, extremely stony surface....147
3090—Glenrose ashy silt loam, 0 to 8 percent slopes....149
3091—Glenrose ashy silt loam, 8 to 25 percent slopes....150
3101—Green Bluff ashy silt loam, 0 to 8 percent slopes....152
3102—Green Bluff ashy silt loam, 8 to 15 percent slopes....154
3110—Fourmound-Stutler complex, 0 to 8 percent slopes....155
3112—Stutler gravelly ashy loam, 0 to 15 percent slopes, extremely bouldery surface....157
3113—Stutler-Springdale complex, 3 to 15 percent slopes....159
3114—Rockly-Fourmound complex, 0 to 15 percent slopes....161
3115—Northstar-Rock outcrop complex, 3 to 15 percent slopes....163
3116—Northstar-Rockly complex, 0 to 8 percent slopes....165
3117—Northstar-Rock outcrop-Rockly complex, 0 to 15 percent slopes....167
3118—Rockly-Cocolalla complex, 0 to 8 percent slopes....169
3120—Marble loamy sand, 0 to 8 percent slopes....171
3121—Marble loamy sand, 8 to 15 percent slopes....172
3122—Marble loamy sand, 15 to 30 percent slopes....174
3123—Marble loamy sand, 30 to 55 percent slopes....175
3126—Rock outcrop-Northstar complex, 15 to 30 percent slopes....177
3127—Marblespring fine gravelly loamy coarse sand, 0 to 8 percent slopes....178
3130—Phoebe ashy sandy loam, 0 to 3 percent slopes....179
3131—Phoebe ashy sandy loam, 3 to 8 percent slopes....181
3132—Bong, moist-Phoebe complex, 8 to 15 percent slopes....182
3133—Phoebe ashy sandy loam, dry, 0 to 3 percent slopes....184
3134—Phoebe ashy sandy loam, dry, 3 to 8 percent slopes....185
3135—Bong-Phoebe, dry, complex, 8 to 15 percent slopes....186
3140—Springdale gravelly ashy coarse sandy loam, 0 to 8 percent slopes....188
3141—Springdale gravelly ashy coarse sandy loam, 8 to 15 percent slopes....190
3142—Spens very gravelly loamy coarse sand, 15 to 30 percent slopes....191
3143—Spens very gravelly loamy coarse sand, 30 to 65 percent slopes....193
3144—Wapal gravelly ashy coarse sandy loam, 0 to 8 percent slopes....194
3145—Wapal gravelly ashy coarse sandy loam, 15 to 30 percent slopes....195
3146—Scoap-Wapal complex, 30 to 60 percent slopes....197
3147—Spens very gravelly loamy coarse sand, cool, 15 to 30 percent slopes....199
3148—Spens very gravelly loamy coarse sand, cool, 30 to 65 percent slopes....200
3200—Torboy fine gravelly ashy coarse sandy loam, 0 to 3 percent slopes....201
3201—Torboy ashy sandy loam, 3 to 8 percent slopes....203

3202—Torboy-Blackprince complex, 8 to 15 percent slopes 204
3210—Kaniksu ashy sandy loam, 0 to 3 percent slopes 206
3211—Kaniksu ashy sandy loam, 3 to 8 percent slopes.....208
3212—Kaniksu, dry-Seaboldt complex, 0 to 8 percent slopes.....209
3220—Stapaloop ashy fine sandy loam, 0 to 8 percent slopes 211
3221—Stapaloop-Kaniksu, dry complex, 8 to 25 percent slopes.....213
3222—Stapaloop-Seaboldt complex, 0 to 8 percent slopes 215
3300—Scrabblers ashy fine sandy loam, 0 to 3 percent slopes 216
3301—Scrabblers ashy fine sandy loam, 3 to 8 percent slopes 218
3302—Scrabblers ashy fine sandy loam, 8 to 15 percent slopes 219
3303—Scrabblers-Torboy complex, 3 to 15 percent slopes.....221
3401—Elmira loamy sand, 3 to 15 percent slopes.....223
3402—Elmira loamy sand, 15 to 30 percent slopes.....224
3403—Elmira loamy sand, 30 to 60 percent slopes.....226
3404—Elmira-Seaboldt complex, 8 to 25 percent slopes 227
3500—Uhlig ashy silt loam, 0 to 8 percent slopes 229
3501—Brincken, moist-Uhlig complex, 0 to 8 percent slopes.....230
3502—Brincken, moist-Fourmound complex, 0 to 15 percent slopes.....232
3503—Uhlig ashy silt loam, dry, 0 to 8 percent slopes 234
3504—Brincken ashy silt loam, 0 to 8 percent slopes 235
3505—Seaboldt, warm-Brincken, moist complex, 0 to 8 percent slopes 237
3600—Seaboldt ashy loam, 0 to 8 percent slopes.....239
3601—Seaboldt ashy loam, 8 to 15 percent slopes.....241
4000—Hunters ashy silt loam, 0 to 8 percent slopes.....242

Soil Survey of Spokane County, Washington

By Scott H. Bare, Natural Resources Conservation Service

Fieldwork by Sue Malone, Chris Miller, Eva Muller, Chandra Neils, Keri Pritchett, Chad Prichard, Timothy Riebe, Kyle Stephens, Jonathan Wald, and Dean White, Natural Resources Conservation Service, and Eric Choker, Jennifer Hendricks, Kevin Kraus, Jenny Krenz, Carol Miller, Stephen Roecker, and Mary Waters, Spokane County Conservation District

Forestry fieldwork by Dennis Robinson and Misty Seaboldt, Natural Resources Conservation Service, and Jason Flowers, Spokane County Conservation District

United States Department of Agriculture, Natural Resources Conservation Service,
in cooperation with the Spokane Conservation District and Washington State University, Agricultural Experiment Station

SPOKANE COUNTY is in the eastern part of Washington State, bordering the Idaho panhandle. The survey area includes the cities of Spokane and Spokane Valley. It encompasses about 1.1 million acres, or about 1,700 square miles.

The survey area consists of mountains, hills, valleys, prairies, plains, and channeled scablands. It is bounded to the east by mountains and hills. Three prominent mountain peaks, from north to south, are Mount Spokane, Mica Peak, and Tekoa Mountain, in the southeastern corner of the survey area. The Spokane Valley is the largest valley, and it is centrally located. Other prominent valleys include the Little Spokane River Valley in the north and the Hangman Valley to the south. The Palouse Prairie, in the southeastern part of the county, is the largest of several prairies. Other prominent smaller prairies in the northwest are the Four Mound, Wild Rose, and Half Moon Prairies. The communities of Airway Heights and Deer Park are on large plains in the western and northern parts of the survey area, respectively. The channeled scablands are south and west of Cheney.

Principle drainageways are the Spokane River, which flows west from Coeur d' Alene Lake; the Little Spokane River, which flows south; and Hangman Creek, which flows north to the confluence with the Spokane River. Pine Creek, in the southern part of the survey area, flows south into Whitman County.

The lowest point, at an elevation of about 1,540 feet, is along the Spokane River (Long Lake), near the Lincoln County line. The city of Spokane, on an outwash terrace, is at an elevation of about 1,900 feet. Mount Spokane, to the northeast, is the highest elevation at 5,890 feet.

This soil survey updates an earlier survey of the county (USDA, 1968). The present survey provides additional information.

Climate

Climate data were recorded at the Spokane Weather Station Office Airport, Washington, in the period 1971 to 2000. Thunderstorm days, relative humidity, percent sunshine, and wind information are estimated from data recorded at this station.

Table 1 gives data on temperature and precipitation, table 2 shows probable dates of the first freeze in fall and the last freeze in spring, and table 3 provides data on the length of the growing season.

In winter, the average temperature is 29 degrees F and the average daily minimum temperature is 23 degrees. The lowest temperature on record, which occurred on December 30, 1968, is -25 degrees. In summer, the average temperature is about 66 degrees and the average daily maximum temperature is about 80 degrees. The highest recorded temperature, which occurred on August 4, 1961, is 108 degrees.

Growing degree days are shown in table 1. They are equivalent to “heat units.” During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature (40 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

The total annual precipitation is about 17 inches. Of this, about 5 inches, or 30 percent, usually falls in May through September. The growing season for most crops falls within this period. The average annual precipitation in the western part of the survey area is 15 to 18 inches. It increases moving eastward to a maximum of about 45 inches on Mount Spokane. The heaviest 1-day rainfall recorded was 1.65 inches on June 22, 1905. Thunderstorms occur on about 10 days each year, and most occur in May through August.

The average seasonal snowfall is about 44 inches, but Mount Spokane receives 150 to 200 inches of snow annually. The average seasonal snowfall in the far western part of the survey area is 35 to 40 inches. The greatest recorded snow depth at any one time was 42 inches on February 1, 1969. On average, 47 days of the year have at least 1 inch of snow on the ground. The heaviest 1-day snowfall recorded was about 13 inches on January 21, 1954.

The average relative humidity in midafternoon is about 50 percent (78 percent in January and 26 percent in July). Humidity is higher at night, and the average at dawn is about 76 percent (85 percent in January and 62 percent in July). The sun shines 76 percent of the time possible in summer and 32 percent in winter. The prevailing wind generally is from the south, but it is from the northeast in November through January. Average windspeed is highest, 10 miles per hour, in March and April.

How This Survey Was Made

This survey was made to provide information about the soils and miscellaneous areas in the survey area. The information includes a description of the soils and miscellaneous areas and their location and a discussion of their suitability, limitations, and management for specified uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils in this survey area were mapped and correlated according to the concepts and limits of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land

uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA. This survey area consists of parts of MLRAs 9, 43A, and 44A.

The soils and miscellaneous areas in the survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs, such as productivity indices for crops and hay. The nonirrigated wheat productivity index in table 6 and the nonirrigated hay productivity indices in table 7 are examples of new interpretations developed for Spokane County. Data are assembled from other sources, such as research information, production records, and field experience of specialists.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

Soil maps are developed after soil scientists have identified and located the significant natural bodies of soils in the survey area. Using a combination of onscreen digitizing and traditional mapping techniques, soil scientists draw soil map unit boundaries on digital and hard copy aerial photography. Soil map units are

evaluated using a variety of digital spatial analyses within a geographic information system (GIS). The primary data layers used in these evaluations are scanned U.S. Geological Survey (USGS) topographic quadrangle maps (DRGs), digital elevation models (DEMs) derived from the USGS National Elevation Dataset (NED), and DEM derivatives, including hillshade, slope, and aspect. Digital data and aerial imagery show relief, topographical features, tonal patterns, vegetation, buildings, fields, roads, and rivers, all of which are helpful in determining accurate boundaries.

General Soil Map Units

The general soil map in this publication shows broad areas that have a distinctive pattern of soils, relief, and drainage. Each map unit on the general soil map is a unique natural landscape. Typically, it consists of one or more major soils or miscellaneous areas and some minor soils or miscellaneous areas. It is named for the major soils or miscellaneous areas. The components of one map unit can occur in another but in a different pattern.

The general soil map can be used to compare the suitability of large areas for general land uses. Areas of suitable soils can be identified on the map. Likewise, areas where the soils are not suitable can be identified.

Because of its small scale, the map is not suitable for planning the management of a farm or field or for selecting a site for a road or building or other structure. The soils in any one map unit differ from place to place in slope, depth, drainage, and other characteristics that affect management.

Soils on Foothills and Mountains

Number of map units: 3
Percentage of survey area: About 19 percent

1. Bouldercreek-Jacot-Boulderjud (igneous and metamorphic parent material; frigid/udic soil climate regime)

Soils on gently sloping to very steep foothills and mountains

Percentage of survey area: About 12 percent
Elevation: 1,970 to 5,000 feet
Parent material: Residuum and colluvium derived from granite, quartz-monzonite, schist, and gneiss with a thick mantle of volcanic ash
Potential native vegetation: Forest-forb plant community with western hemlock, grand fir, western redcedar, wild ginger, and queencup beadlily
Minor components: Hysing, Quinnamose, Micapeak, Blackprince, Kellerbutte, Brickel, and Vaywood soils

Bouldercreek soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high over high
Texture of surface layer: Ashy silt loam
Slope range: 3 to 70 percent

Jacot soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high over high
Texture of surface layer: Ashy silt loam
Slope range: 3 to 55 percent

Boulderjud soils
Depth: Deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high over high
Texture of surface layer: Ashy silt loam
Slope range: 15 to 60 percent

2. Lenz-Spokane-Kramerhill-Rock outcrop (igneous and metamorphic parent material; mesic/xeric soil climate regime)

Gently sloping to steep foothills and mountains

Percentage of survey area: About 6 percent
Elevation: 1,700 to 3,600 feet
Parent material: Residuum and colluvium derived from granite, gneiss, and schist with a minor amount of volcanic ash and loess in the upper part
Potential native vegetation: Forest-shrub plant community with ponderosa pine, common snowberry, creambush oceanspray, and mallow ninebark
Minor components: Glenrose, Micapeak, Quinnamose, and Kruse soils

Lenz soils
Depth: Moderately deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Very gravelly ashy sandy loam
Slope range: 3 to 60 percent

Spokane soils
Depth: Moderately deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy loam
Slope range: 3 to 55 percent

Kramerhill soils
Depth: Deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy loam
Slope range: 3 to 40 percent

Rock outcrop
Description of areas: Granitic rock exposed at the surface that supports very sparse or no vegetation

3. Ardenvoir-Tekoa-Lotuspoint (metasedimentary parent material; frigid, mesic/xeric soil climate regime)

Moderately sloping to very steep foothills and mountains

Percentage of survey area: About 1 percent
Elevation: 2,080 to 4,840 feet
Parent material: Residuum and colluvium derived from metasedimentary rock such as siltite and fine-grained quartzite with an influence of volcanic ash and loess in the upper part
Potential native vegetation: Forest-shrub and shrub-grass plant communities with grand fir, Rocky Mountain Douglas-fir, ponderosa pine, common snowberry, creambush oceanspray, mallow ninebark, Idaho fescue, and bluebunch wheatgrass
Minor components: McCrosket, Pinecreek, Cassyhill, Libertybutte, and Schumacher soils

Ardenvoir soils
Depth: Deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Gravelly ashy silt loam
Slope range: 5 to 65 percent

Tekoa soils
Depth: Moderately deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Gravelly ashy silt loam
Slope range: 10 to 65 percent

Lotuspoint soils
Depth: Moderately deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Stony ashy silt loam
Slope range: 5 to 65 percent

Loessal Soils on Basalt Plateaus

Number of map units: 2
Percentage of survey area: About 20 percent

4. Naff-Garfield-Thatuna (loess parent material; mesic/xeric soil climate regime)

Level to steep loess hills on basalt plateaus

Percentage of survey area: About 17 percent
Elevation: 2,100 to 2,880 feet
Parent material: Loess

Potential native vegetation: Shrub-grass plant communities with bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, needle and thread, Saskatoon serviceberry, common snowberry, rose, and several species of sagebrush
Minor components: Larkin, Southwick, Driscoll, Glenrose, Freeman, and Caldwell soils

Naff soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Silt loam
Slope range: 0 to 35 percent

Garfield soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately low
Texture of surface layer: Silt loam
Slope range: 3 to 35 percent

Thatuna soils
Depth: Very deep
Drainage class: Moderately well drained
Saturated hydraulic conductivity (Ksat): Moderately low
Texture of surface layer: Silt loam
Slope range: 3 to 30 percent

5. Athena-Broadax-Reardan (loess parent material; mesic/xeric soil climate regime)

Level to steep loess hills on remnant loess islands of channeled scablands

Percentage of survey area: About 3 percent
Elevation: 2,100 to 2,800 feet
Parent material: Loess
Potential native vegetation: Shrub-grass plant communities with bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, needle and thread, Saskatoon serviceberry, common snowberry, rose, and several species of sagebrush
Minor components: Lance, Hanning, Brincken, Cheney, and Mondovi soils

Athena soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Silt loam
Slope range: 0 to 60 percent

Broadax soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Silt loam
Slope range: 0 to 30 percent

Reardan soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately low
Texture of surface layer: Silt loam
Slope range: 0 to 25 percent

Soils on Channeled Scablands and Basalt Plateaus

Number of map units: 3
Percentage of survey area: About 29 percent

6. Rockly-Northstar-Rock outcrop-Cocolalla (basalt and volcanic ash parent material; mesic/xeric and aquic soil climate regime)

Level to steep slopes and depressions of basalt plateaus

Percentage of survey area: About 20 percent
Elevation: 1,800 to 2,600 feet
Parent material: Residuum and colluvium derived from basalt mixed with loess and volcanic ash, and alluvium derived from volcanic ash
Potential native vegetation: Shrub-grass, forest-shrub, and wet meadow plant communities with bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, needle and thread, Saskatoon serviceberry, common snowberry, rose, several species of sagebrush, ponderosa pine, rushes, and sedges
Minor components: Hardesty, Fourmound, Deno, Alecanyon, Stutler, and Tucannon soils and water

Rockly soils
Depth: Very shallow
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Very cobbly loam
Slope range: 0 to 35 percent

Northstar soils
Depth: Moderately deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Extremely cobbly ashy loam
Slope range: 0 to 30 percent

Rock outcrop
Description of areas: Basalt exposed at the surface that supports very sparse or no vegetation

Cocolalla soils
Depth: Very deep
Drainage class: Poorly drained
Saturated hydraulic conductivity (Ksat): Moderately high

Texture of surface layer: Ashy silt loam
Slope range: 0 to 3 percent

7. Cheney-Alecanyon-Phoebe-Stutler (outwash parent material; mesic/xeric soil climate regime)

Level to steep treads and risers on outwash plains

Percentage of survey area: About 7 percent
Elevation: 1,700 to 2,550 feet
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of loess and volcanic ash in the upper part
Potential native vegetation: Shrub-grass and forest-shrub plant communities with bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, needle and thread, Saskatoon serviceberry, common snowberry, rose, several species of sagebrush, and ponderosa pine
Minor components: Bong, Brincken, Seaboldt, Rockly, Uhlig, Hagen, and Narcisse soils

Cheney soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high in the upper part and very high in the lower part
Texture of surface layer: Ashy silt loam
Slope range: 0 to 15 percent

Alecanyon soils
Depth: Very deep
Drainage class: Somewhat excessively drained
Saturated hydraulic conductivity (Ksat): High
Texture of surface layer: Gravelly ashy coarse sandy loam
Slope range: 0 to 40 percent

Phoebe soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): High
Texture of surface layer: Ashy sandy loam
Slope range: 0 to 15 percent

Stutler soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Gravelly ashy silt loam
Slope range: 0 to 15 percent

8. Brincken-Lakespring-Seaboldt (glaciofluvial and loess parent material; mesic/xeric soil climate regime)

Level to moderately steep slopes on outwash terraces and plains and foothills

Percentage of survey area: About 2 percent
Elevation: 1,800 to 2,600 feet

Parent material: Glaciofluvial and laminated glaciolacustrine deposits and loess with a minor amount of loess and volcanic ash in the upper part
Potential native vegetation: Forest-shrub plant communities with Saskatoon serviceberry, common snowberry, rose, mallow ninebark, redstem ceanothus, and ponderosa pine
Minor components: Cheney soils, Xerolls, and Nez Perce, Fourmound, Uhlig, and Bong soils

Brincken soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy silt loam
Slope range: 0 to 25 percent

Lakespring soils
Depth: Moderately deep to a densic contact
Drainage class: Moderately well drained
Saturated hydraulic conductivity (Ksat): Moderately low
Texture of surface layer: Ashy loam
Slope range: 0 to 25 percent

Seaboldt soils
Depth: Moderately deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy loam
Slope range: 0 to 15 percent

Soils on and adjacent to Basalt Canyons, Escarpments, and Plateaus

Number of map units: 2
Percentage of survey area: About 12 percent

9. Marble-Springdale-Spens (sandy outwash parent material; mesic/xeric soil climate regime)

Level to very steep treads and risers on outwash plains and terraces

Percentage of survey area: About 7 percent
Elevation: 1,540 to 2,500 feet
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of loess and volcanic ash in the upper part in some areas
Potential native vegetation: Forest-grass and shrub plant communities with Idaho fescue, bluebunch wheatgrass, Saskatoon serviceberry, common snowberry, rose, and ponderosa pine
Minor components: Haploxerolls, channeled; water; Marblespring soils; Endoaquolls; Fluvaquents; and Wapal and Scoap soils

Marble soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): High

Texture of surface layer: Loamy sand
Slope range: 0 to 55 percent

Springdale soils
Depth: Very deep
Drainage class: Somewhat excessively drained
Saturated hydraulic conductivity (Ksat): High
Texture of surface layer: Gravelly ashy coarse sandy loam
Slope range: 0 to 15 percent

Spens soils
Depth: Very deep
Drainage class: Somewhat excessively drained
Saturated hydraulic conductivity (Ksat): Very high
Texture of surface layer: Very gravelly loamy coarse sand
Slope range: 15 to 65 percent

10. Klickson-Speigle-Xerolls, mass wasted-Rock outcrop (basalt parent material; frigid, mesic/xeric soil climate regime)

Moderately sloping to very steep basalt canyon escarpments, earthflows, and plateaus

Percentage of survey area: About 5 percent
Elevation: 1,650 to 2,700 feet
Parent material: Colluvium and residuum derived from basalt with a minor amount of loess and volcanic ash in the upper part in some areas
Potential native vegetation: Forest-shrub plant communities with Idaho fescue, bluebunch wheatgrass, mallow ninebark, creambush oceanspray, common snowberry, rose, Rocky Mountain Douglas-fir, and ponderosa pine
Minor components: Haploxerolls, channeled, and Northstar, Gibbs, Bobbitt, Scoap, and Wapal soils

Klickson soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Gravelly ashy silt loam
Slope range: 15 to 80 percent

Speigle soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Cobbly ashy loam
Slope range: 8 to 80 percent

Xerolls, mass wasted
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Silt loam
Slope range: 8 to 25 percent

Rock outcrop
Description of area: Basalt exposed at the surface that supports very sparse or no vegetation

Glaciofluvial Soils in Broad Valleys

Number of map units: 3
Percentage of survey area: About 20 percent

11. Kaniksu-Torboy-Stapaloop-Scrabblers (sandy and loamy outwash parent material; frigid/xeric soil climate regime)

Level to moderately steep treads and risers on outwash plains and terraces

Percentage of survey area: About 10 percent
Elevation: 1,800 to 2,900 feet
Parent material: Sandy glaciofluvial deposits with a thin mantle of loess and volcanic ash in the upper part
Potential native vegetation: Forest-shrub plant communities with pinegrass, bluebunch wheatgrass, mallow ninebark, creambush oceanspray, common snowberry, Saskatoon serviceberry, rose, grand fir, Rocky Mountain Douglas-fir, western larch, and ponderosa pine
Minor components: Stien, Bonner, Eloika, Fan Lake, Elmira, Wapal, and Clayton soils

Kaniksu soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): High
Texture of surface layer: Ashy sandy loam
Slope range: 0 to 25 percent

Torboy soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): High
Texture of surface layer: Fine gravelly ashy coarse sandy loam
Slope range: 0 to 15 percent

Stapaloop soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy fine sandy loam
Slope range: 0 to 25 percent

Scrabblers soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy fine sandy loam
Slope range: 0 to 15 percent

12. Urban land-Opportunity-Marble, disturbed (outwash parent material; mesic/xeric soil climate regime)

Level to moderately steep treads and risers on outwash plains and terraces

Percentage of survey area: About 9 percent
Elevation: 1,750 to 2,360 feet

Parent material: Glaciofluvial deposits mixed with loess and volcanic ash in the upper part
Potential native vegetation: Forest-grasses plant community with Idaho fescue, bluebunch wheatgrass, Saskatoon serviceberry, and ponderosa pine
Minor components: Water; Opportunity soils, disturbed; Marble soils; Springdale soils, disturbed; Northstar soils; Xerolls, mass wasted; and Garrison soils

Urban land
Description of areas: Land covered by pavement, buildings, storage tanks, bridges, and other impervious surfaces and structures

Opportunity soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Very gravelly ashy loam
Slope range: 0 to 15 percent

Marble soils, disturbed
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): High
Texture of surface layer: Loamy sand
Slope range: 0 to 30 percent

13. Green Bluff-Cedonia-Hunters (glaciolacustrine parent material; frigid, mesic/xeric soil climate regime)

Level to moderately steep treads and risers on outwash plains and relict glacial lake terraces

Percentage of survey area: About 1 percent
Elevation: 1,800 to 2,400 feet
Parent material: Glaciofluvial and calcareous glaciolacustrine deposits mixed with loess and volcanic ash in the upper part
Potential native vegetation: Forest-shrub plant communities with pinegrass, mallow ninebark, common snowberry, Rocky Mountain Douglas-fir, western larch, and ponderosa pine
Minor components: Peone, Saltese, Hoodoo, Kronquist, Fan Lake, and Clayton soils

Green Bluff soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy silt loam
Slope range: 0 to 15 percent

Cedonia soils
Depth: Very deep
Drainage class: Well drained
Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy silt loam
Slope range: 0 to 25 percent

Hunters soils
Depth: Very deep
Drainage class: Well drained

Saturated hydraulic conductivity (Ksat): Moderately high
Texture of surface layer: Ashy silt loam
Slope range: 0 to 8 percent

Detailed Soil Map Units

The map units delineated on the detailed soil maps in this survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Minor soil components that have properties similar to those of the dominant soil or soils in the map unit do not affect use and management. They are called noncontrasting, or similar, components. They typically are not mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. The contrasting components are mentioned in the map unit descriptions. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit.

Soils that have profiles that are almost alike make up a *soil series*. All the soils of a series have major horizons that are similar in composition, thickness, and arrangement. The soils of a given series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name

of a soil phase commonly indicates a feature that affects use or management. For example, Stutler gravelly ashy loam, 0 to 15 percent slopes, extremely bouldery surface, is a phase of the Stutler series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Rockly-Cocolalla complex, 0 to 8 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. McCrosket-Ardenvoir association, 15 to 35 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Endoquolls and Fluvaquents, 0 to 3 percent slopes, is an undifferentiated group in this survey area.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Each detailed soil map unit is assigned to a major land resource area (MLRA) (USDA Agriculture Handbook 296). The MLRA assigned to each detailed soil map unit is given in this section. Some map units, such as Rock outcrop, Water, and other miscellaneous areas, may not be assigned to a single MLRA because the unit can occur in any MLRA.

Table 4 gives the acreage and proportionate extent of each map unit. Table 5 gives the percentage and slope of each component in the map units. Other tables give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

1001—Bridgeson ashy silt loam, 0 to 3 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 44A—Northern Rocky Mountain Valleys
Elevation: 1,900 to 2,240 feet
Mean annual precipitation: 20 to 30 inches
Mean annual air temperature: 43 to 46 degrees F
Frost-free period: 80 to 110 days

Map Unit Composition

Bridgeson and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Bridgeson

Setting
Landform: Drainageways
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear

Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from glaciolacustrine sediment with an influence of volcanic ash in the upper part
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Occasional (see Water Features table)
Ponding frequency: None
Seasonal high water table (minimum depth): About 10 to 20 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 12.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 5w
Ecological site: WET MEADOW 16-24 PZ (R044XY601WA)

Typical profile
Ap—0 to 12 inches; ashy silt loam
Bg1—12 to 20 inches; silt loam
Bg2—20 to 31 inches; clay loam
Bg3—31 to 40 inches; clay loam
Bg4—40 to 60 inches; clay loam

Dissimilar Minor Components

Hoodoo soils
Percentage of map unit: 10 percent
Landform: Flood plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Concave
Across-slope shape: Concave

Wolfeson soils
Percentage of map unit: 5 percent
Landform: Relict glacial lake terraces
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave

Pywell soils
Percentage of map unit: 3 percent
Landform: Drainageways, flood plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear, concave
Across-slope shape: Concave

Endoaquolls
Percentage of map unit: 2 percent
Landform: Drainageways, stream terraces, flood plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear

1010—Caldwell-Thatuna complex, 0 to 8 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,100 to 2,600 feet
Mean annual precipitation: 17 to 22 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Map Unit Composition

Caldwell and similar soils: 65 percent
Thatuna and similar soils: 15 percent
Dissimilar minor components: 20 percent

Characteristics of Caldwell

Setting
Landform: Drainageways
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from loess
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Occasional (see Water Features table)
Ponding frequency: None
Seasonal high water table (minimum depth): About 16 to 21 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 12 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4w
Ecological site: LOAMY BOTTOM 16-24 PZ (R009XY402WA)

Typical profile
Ap1—0 to 4 inches; silt loam
Ap2—4 to 10 inches; silt loam
A1—10 to 16 inches; silt loam
A2—16 to 21 inches; silt loam
AB—21 to 30 inches; silt loam
Bw—30 to 40 inches; silt loam
Bt1—40 to 52 inches; silt loam
Bt2—52 to 60 inches; silt loam

Characteristics of Thatuna

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Footslopes
Geomorphic position (three-dimensional): Base slopes

Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Recent loess over older loess
Slope range: 3 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 24 to 36 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 10.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3w
Ecological site: COOL LOAMY 16-24 PZ (R009XY103WA)

Typical profile
A1—0 to 6 inches; silt loam
A2—6 to 12 inches; silt loam
AB—12 to 19 inches; silt loam
Bw—19 to 28 inches; silt loam
E—28 to 35 inches; silt loam
Btb/E—35 to 43 inches; silty clay loam
Btb1—43 to 52 inches; silty clay loam
Btb2—52 to 60 inches; silty clay loam

Dissimilar Minor Components

Cald soils
Percentage of map unit: 10 percent

1020—Cocolalla ashy silt loam, 0 to 3 percent slopes

Map Unit Setting

General landscape: Channeled scablands
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,020 to 2,450 feet
Mean annual precipitation: 15 to 20 inches
Mean annual air temperature: 46 to 48 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Cocolalla and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Cocolalla

Setting
Landform: Drainageways, depressions
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from volcanic ash mixed with loess in the upper part
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Frequent (see Water Features table)
Ponding frequency: Frequent (see Water Features table)
Seasonal high water table (minimum depth): At the soil surface to a depth of 11 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 13.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 5w
Ecological site: WET MEADOW 16-24 PZ (R009XY601WA)

Typical profile
A1—0 to 11 inches; ashy silt loam
A2—11 to 28 inches; ashy silt loam
Cg1—28 to 37 inches; ashy silt loam
Cg2—37 to 43 inches; ashy silt loam
Ab—43 to 54 inches; ashy silt loam
Cgb—54 to 60 inches; ashy silt loam

1021—Cocolalla-Hardesty complex, 0 to 3 percent slopes

Map Unit Setting

General landscape: Channeled scablands (fig. 1)
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,950 to 2,400 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Cocolalla and similar soils: 50 percent
Hardesty and similar soils: 40 percent
Dissimilar minor components: 10 percent

Characteristics of Cocolalla

Setting
Landform: Drainageways, depressions
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from volcanic ash mixed with loess in the upper part
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Poorly drained

Figure 1.—Typical area of Cocolalla-Hardesty complex, 0 to 3 percent slopes (nonforested area).

Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Frequent (see Water Features table)
Ponding frequency: Frequent (see Water Features table)
Seasonal high water table (minimum depth): At the soil surface to a depth of 11 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 13.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 5w
Ecological site: WET MEADOW 16-24 PZ (R009XY601WA)

Typical profile
A1—0 to 11 inches; ashy silt loam
A2—11 to 28 inches; ashy silt loam
Cg1—28 to 37 inches; ashy silt loam
Cg2—37 to 43 inches; ashy silt loam
Ab—43 to 54 inches; ashy silt loam
Cgb—54 to 60 inches; ashy silt loam

Characteristics of Hardesty

Setting
Landform: Depressions, drainageways, stream terraces
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear, concave
Across-slope shape: Linear, concave
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from volcanic ash mixed with loess in the upper part
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Rare (see Water Features table)
Ponding frequency: None
Seasonal high water table (minimum depth): About 23 to 30 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2w
Forest Service habitat type: Ponderosa pine/ninebark (CN190)

Typical profile
A1—0 to 4 inches; ashy silt loam
A2—4 to 11 inches; ashy silt loam
Bw1—11 to 23 inches; ashy silt loam
Bw2—23 to 32 inches; ashy silt loam
C1—32 to 39 inches; ashy very fine sandy loam
C2—39 to 60 inches; ashy loamy very fine sand

1120—Lovell ashy silt loam, 0 to 3 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,300 to 2,800 feet
Mean annual precipitation: 18 to 25 inches
Mean annual air temperature: 42 to 46 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Lovell and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Lovell

Setting
Landform: Drainageways
Geomorphic position (three-dimensional): Treads

Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Mixed alluvium with an influence of loess and volcanic ash in the upper part
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Occasional (see Water Features table)
Ponding frequency: None
Seasonal high water table (minimum depth): About 19 to 24 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 12.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3w
Ecological site: SEMI-WET MEADOW 15+ PZ (R044XY602WA)

Typical profile
Ap1—0 to 2 inches; ashy silt loam
Ap2—2 to 8 inches; ashy silt loam
BE—8 to 19 inches; ashy silt loam
E—19 to 24 inches; silt loam
Bt/E—24 to 30 inches; silty clay loam
Bt1—30 to 42 inches; silty clay loam
Bt2—42 to 52 inches; silty clay loam
Bt3—52 to 61 inches; silty clay loam

Dissimilar Minor Components

Landform: Escarpments
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear

Rock outcrop
Percentage of map unit: 5 percent

Spens soils
Percentage of map unit: 3 percent
Landform: Outwash terraces
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Convex

Xerolls, frigid, mass wasted
Percentage of map unit: 3 percent
Landform: Earthflows
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Convex

Fan Lake soils
Percentage of map unit: 2 percent
Landform: Relict glacial lake terraces, outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear

Lacy soils
Percentage of map unit: 2 percent
Landform: Basalt plateaus
Geomorphic position (two-dimensional): Shoulders
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Convex
Across-slope shape: Convex

2044—Klickson-Speigle complex, 30 to 60 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,800 to 2,600 feet
Mean annual precipitation: 18 to 23 inches
Mean annual air temperature: 42 to 50 degrees F
Frost-free period: 90 to 130 days

Map Unit Composition

Klickson and similar soils: 40 percent
Speigle and similar soils: 40 percent
Dissimilar minor components: 20 percent

Characteristics of Klickson

Setting
Landform: Escarpments
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear

Aspect (representative): North
Aspect (range): West to east (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 30 to 60 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A1—3 to 8 inches; gravelly ashy silt loam
A2—8 to 12 inches; gravelly ashy loam
BA—12 to 17 inches; gravelly ashy loam
Bt1—17 to 28 inches; very cobbly loam
Bt2—28 to 35 inches; very stony loam
Bt3—35 to 50 inches; extremely stony loam
BC—50 to 60 inches; extremely cobbly loam

Characteristics of Speigle

Setting
Landform: Escarpments
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): West
Aspect (range): East to north (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 30 to 60 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
A—0 to 6 inches; cobbly ashy loam
AB—6 to 17 inches; very gravelly ashy loam
Bt1—17 to 23 inches; very cobbly loam
Bt2—23 to 35 inches; extremely gravelly loam
BC—35 to 44 inches; extremely cobbly sandy loam
C—44 to 65 inches; extremely cobbly sandy loam

Dissimilar Minor Components

Landform: Basalt plateaus
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Northeast to northwest (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 0 to 8 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; cobbly ashy loam
AB—6 to 16 inches; very cobbly ashy loam
Bt—16 to 33 inches; extremely cobbly loam
BC—33 to 38 inches; extremely cobbly clay loam
R—38 to 48 inches; bedrock

Characteristics of Lacy

Setting
Landform: Basalt plateaus
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Properties and qualities
Parent material: Loess over colluvium and residuum derived from basalt
Slope range: 0 to 8 percent
Depth to restrictive feature: 10 to 20 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 1 inch)

Interpretive groups
Land capability subclass (nonirrigated): 7s
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
A—0 to 2 inches; cobbly loam
AB—2 to 6 inches; extremely cobbly loam
Bt—6 to 10 inches; extremely cobbly loam
BC—10 to 16 inches; extremely stony loam
R—16 to 26 inches; bedrock

Dissimilar Minor Components

2071—Bobbitt-Speigle complex, 8 to 25 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,950 to 2,700 feet
Mean annual precipitation: 18 to 23 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Bobbitt and similar soils: 50 percent
Speigle and similar soils: 25 percent
Dissimilar minor components: 25 percent

Characteristics of Bobbitt

Setting
Landform: Basalt plateaus
Geomorphic position (two-dimensional): Shoulders
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Northeast to northwest (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 8 to 25 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; cobbly ashy loam
AB—6 to 16 inches; very cobbly ashy loam
Bt—16 to 33 inches; extremely cobbly loam
BC—33 to 38 inches; extremely cobbly clay loam
R—38 to 48 inches; bedrock

Characteristics of Speigle

Setting
Landform: Basalt plateaus
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): South
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 8 to 25 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
A—0 to 6 inches; cobbly ashy loam
AB—6 to 17 inches; very gravelly ashy loam
Bt1—17 to 23 inches; very cobbly loam
Bt2—23 to 35 inches; extremely gravelly loam
BC—35 to 44 inches; extremely cobbly sandy loam
C—44 to 65 inches; extremely cobbly sandy loam

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,600 to 2,400 feet
Mean annual precipitation: 18 to 22 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Bong, moist, and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Bong, Moist

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat excessively drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3s
Land capability subclass (irrigated): 3e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 11 inches; ashy sandy loam
Bw—11 to 22 inches; sandy loam
BC—22 to 28 inches; gravelly coarse sandy loam
C—28 to 60 inches; coarse sand

Dissimilar Minor Components

Phoebe soils
Percentage of map unit: 10 percent
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear

Hagen soils
Percentage of map unit: 5 percent
Landform: Outwash terraces
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Convex

Marblespring soils
Percentage of map unit: 3 percent
Landform: Outwash terraces
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear

Hardesty soils
Percentage of map unit: 2 percent
Landform: Depressions, drainageways
Downslope shape: Linear, concave
Across-slope shape: Linear, concave

3024—Phoebe-Bong, moist, complex, 0 to 8 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,800 to 2,500 feet
Mean annual precipitation: 18 to 22 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Phoebe and similar soils: 45 percent
Bong, moist, and similar soils: 40 percent
Dissimilar minor components: 15 percent

Characteristics of Phoebe

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part

Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2e
Land capability subclass (irrigated): 3e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 8 inches; ashy sandy loam
A—8 to 16 inches; ashy sandy loam
Bw1—16 to 25 inches; fine sandy loam
Bw2—25 to 34 inches; sandy loam
C1—34 to 44 inches; loamy sand
C2—44 to 60 inches; sand

Characteristics of Bong, Moist

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat excessively drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline

3025—Bong ashy sandy loam, moist, 15 to 30 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,050 to 2,360 feet
Mean annual precipitation: 18 to 21 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Bong, moist, and similar soils: 75 percent
Dissimilar minor components: 25 percent

Characteristics of Bong, Moist

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): East
Aspect (range): Northwest to south (clockwise)

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 15 to 30 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat excessively drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 11 inches; ashy sandy loam
Bw—11 to 22 inches; sandy loam
BC—22 to 28 inches; gravelly coarse sandy loam
C—28 to 60 inches; coarse sand

Dissimilar Minor Components

3030—Bonner ashy fine sandy loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 44A—Northern Rocky Mountain valleys
Elevation: 1,900 to 2,400 feet
Mean annual precipitation: 22 to 26 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Bonner and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Bonner

Setting
Landform: Outwash terraces
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Thick mantle of volcanic ash mixed with loess over outwash
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline

Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 3 inches; moderately decomposed plant material
A—3 to 5 inches; ashy fine sandy loam
Bw1—5 to 9 inches; ashy fine sandy loam
Bw2—9 to 19 inches; ashy fine sandy loam
2BC—19 to 27 inches; very gravelly loamy sand
2C—27 to 60 inches; extremely gravelly coarse sand

Dissimilar Minor Components

3039—Alecanyon-Rockly complex, 0 to 15 percent slopes

Map Unit Setting

General landscape: Channeled scablands (fig. 6)
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,980 to 2,500 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Figure 6.—Typical area of Alecanyon-Rockly complex, 0 to 15 percent slopes. The Rockly soil is in foreground under rangeland ecological site R009XY301WA. Stiff sagebrush (*Artemisia rigida*) is the dominant shrub on the Rockly soil. The Alecanyon soil is between convex areas of Rockly soils and supports rangeland ecological site R009XY202WA.

Map Unit Composition

Alecanyon and similar soils: 40 percent
Rockly and similar soils: 30 percent
Dissimilar minor components: 30 percent

Characteristics of Alecanyon

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of loess and volcanic ash in the upper part
Slope range: 0 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat excessively drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 1.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6s
Ecological site: STONY 16-24 PZ (R009XY202WA)

Typical profile
A—0 to 7 inches; gravelly ashy coarse sandy loam
BA—7 to 11 inches; very gravelly ashy coarse sandy loam
BC—11 to 16 inches; extremely cobbly loamy coarse sand
Bq—16 to 39 inches; extremely gravelly coarse sand
C—39 to 60 inches; very gravelly coarse sand

Characteristics of Rockly

Setting
Landform: Basalt plateaus
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 0 to 15 percent
Depth to restrictive feature: 4 to 12 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 0.5 inch)

Interpretive groups
Land capability subclass (nonirrigated): 7s
Ecological site: VERY SHALLOW 16-24 PZ (R009XY301WA)

Typical profile
A—0 to 3 inches; very cobbly loam
Bw—3 to 6 inches; very cobbly loam
R—6 to 16 inches; bedrock

General landscape: Channeled scablands
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,980 to 2,550 feet
Mean annual precipitation: 15 to 17 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Map Unit Composition

Alecanyon, very stony surface, and similar soils: 65 percent
Cheney and similar soils: 25 percent
Dissimilar minor components: 10 percent

Characteristics of Alecanyon, Very Stony Surface

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of loess and volcanic ash in the upper part
Slope range: 8 to 15 percent
Surface area covered with stones: 0.1 to 3.0 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat excessively drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7s
Ecological site: STONY 16-24 PZ (R009XY202WA)

Typical profile
A—0 to 7 inches; cobbly ashy coarse sandy loam
BA—7 to 11 inches; very cobbly ashy coarse sandy loam
BC—11 to 16 inches; extremely cobbly loamy coarse sand

Bq—16 to 39 inches; extremely cobbly coarse sand
C—39 to 60 inches; very gravelly coarse sand

Characteristics of Cheney

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over sandy and gravelly glaciofluvial deposits
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 10 inches; ashy silt loam
A—10 to 14 inches; ashy silt loam
Bw—14 to 22 inches; ashy silt loam
Bt—22 to 28 inches; ashy silt loam
2C1—28 to 32 inches; very gravelly sandy loam
2C2—32 to 60 inches; extremely gravelly coarse sand

3045—Rockly-Deno complex, 0 to 15 percent slopes

Map Unit Setting

General landscape: Channeled scablands (fig. 7)
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,820 to 2,500 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Map Unit Composition

Rockly and similar soils: 60 percent
Deno and similar soils: 25 percent
Dissimilar minor components: 15 percent

Figure 7.—Typical area of Rockly-Deno complex, 0 to 15 percent slopes. The Rockly soil is in foreground under rangeland ecological site R009XY301WA. Stiff sagebrush (*Artemisia rigida*) is the dominant shrub on the Rockly soil. The Deno soil is on mounds and supports rangeland ecological site R009XY102WA.

Characteristics of Rockly

Setting

Landform: Basalt plateaus
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities

Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 0 to 15 percent
Depth to restrictive feature: 4 to 12 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 0.5 inch)

Interpretive groups
Land capability subclass (nonirrigated): 7s
Ecological site: VERY SHALLOW 16-24 PZ (R009XY301WA)

Typical profile
A—0 to 3 inches; very cobbly loam
Bw—3 to 6 inches; very cobbly loam
R—6 to 16 inches; bedrock

Characteristics of Deno

Setting
Landform: Mounds on basalt plateaus
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over residuum derived from basalt or glaciofluvial deposits
Slope range: 0 to 15 percent
Depth to restrictive feature: 40 to 60 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 8.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
A1—0 to 4 inches; ashy silt loam
A2—4 to 14 inches; ashy loam
A3—14 to 28 inches; ashy loam
Bw1—28 to 40 inches; loam
Bw2—40 to 48 inches; coarse sandy loam
2R—48 to 58 inches; bedrock

Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 8 to 25 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 7.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap1—0 to 5 inches; ashy fine sandy loam
Ap2—5 to 8 inches; ashy fine sandy loam
E and Bt1—8 to 29 inches; sandy loam
E and Bt2—29 to 42 inches; sandy loam
E and Bt3—42 to 52 inches; loamy sand
C—52 to 62 inches; loamy fine sand

Characteristics of Hagen

Setting
Landform: Outwash terraces
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear

Across-slope shape: Convex
Aspect (representative): Southwest
Aspect (range): Southeast to northwest (clockwise)

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of loess and volcanic ash in the upper part
Slope range: 8 to 25 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 7 inches; ashy sandy loam
Bw—7 to 15 inches; ashy sandy loam
E and Bt1—15 to 29 inches; loamy sand
E and Bt2—29 to 52 inches; loamy sand
C—52 to 60 inches; sand

3060—Dearyton ashy silt loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain foothills (fig. 8)
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,360 to 2,800 feet
Mean annual precipitation: 18 to 25 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Figure 8.—Typical area of Dearyton ashy silt loam, 0 to 8 percent slopes, under cultivation in foreground. In uncultivated areas, the Dearyton soil supports a ponderosa pine/common snowberry habitat type.

Map Unit Composition

Dearyton and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Dearyton

Setting
Landform: Hills
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Loess with an influence of volcanic ash over colluvium and residuum derived from saprolitic gneiss, quartzite, Latah Formation, or till
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 6 to 12 inches, perched (see Water Features table)
Salinity (maximum): Not saline

Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 9.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6w
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 6 inches; ashy silt loam
BE—6 to 12 inches; ashy silt loam
2Bt1—12 to 18 inches; clay loam
2Bt2—18 to 28 inches; clay loam
2Bt3—28 to 38 inches; clay loam
2Bt4—38 to 55 inches; clay loam
2Bt5—55 to 60 inches; gravelly clay loam

3080—Opportunity very gravelly ashy loam, 0 to 3 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys (fig. 9)
Major land resource area (MLRA): 44A—Northern Rocky Mountain valleys
Elevation: 1,800 to 2,200 feet
Mean annual precipitation: 18 to 25 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Figure 9.—Typical area of Opportunity very gravelly ashy loam, 0 to 3 percent slopes, under cultivation. Urban land-Opportunity, disturbed, 0 to 3 percent slopes, is beyond the river, in Spokane Valley.

Map Unit Composition

Opportunity and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Opportunity

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4s
Land capability subclass (irrigated): 2s
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Ap—0 to 7 inches; very gravelly ashy loam
A1—7 to 13 inches; extremely gravelly ashy loam
A2—13 to 19 inches; extremely gravelly ashy loam
Bw1—19 to 33 inches; extremely gravelly loam
Bw2—33 to 43 inches; extremely gravelly loam
Bq—43 to 53 inches; extremely gravelly loamy coarse sand
BCk—53 to 60 inches; extremely gravelly coarse sand

Dissimilar Minor Components

Bong soils, moist
Percentage of map unit: 10 percent
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads

3090—Glenrose ashy silt loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,380 to 2,780 feet
Mean annual precipitation: 18 to 25 inches
Mean annual air temperature: 45 to 48 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Glenrose and similar soils: 60 percent
Dissimilar minor components: 40 percent

Characteristics of Glenrose

Setting
Landform: Hills
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over material derived from saprolitic gneiss, quartzite, or Latah Formation
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 10.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 8 inches; ashy silt loam
AB—8 to 14 inches; ashy silt loam
Bw—14 to 19 inches; silt loam
Bt/E—19 to 24 inches; silty clay loam
Bt1—24 to 32 inches; silty clay loam
Bt2—32 to 41 inches; clay loam
Bt3—41 to 60 inches; clay loam

3110—Fourmound-Stutler complex, 0 to 8 percent slopes

Map Unit Setting

General landscape: Channeled scablands
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,900 to 2,500 feet
Mean annual precipitation: 16 to 20 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Fourmound and similar soils: 45 percent
Stutler and similar soils: 40 percent
Dissimilar minor components: 15 percent

Characteristics of Fourmound

Setting
Landform: Mounds on basalt plateaus
Downslope shape: Linear, convex
Across-slope shape: Linear, convex
Aspect (range): All aspects

Properties and qualities
Parent material: Glaciofluvial deposits and loess mixed with a minor amount of volcanic ash over residuum derived from basalt
Slope range: 0 to 8 percent
Depth to restrictive feature: 40 to 60 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 7.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
A1—0 to 4 inches; gravelly ashy silt loam
A2—4 to 9 inches; ashy silt loam
A3—9 to 15 inches; ashy silt loam
Bw1—15 to 30 inches; silt loam
Bw2—30 to 43 inches; silt loam
2BC—43 to 47 inches; extremely gravelly silt loam
2R—47 to 57 inches; bedrock

Characteristics of Stutler

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; gravelly ashy silt loam
Bw1—5 to 12 inches; gravelly ashy silt loam
Bw2—12 to 22 inches; very cobbly silt loam
Bw3—22 to 32 inches; extremely cobbly loam
Bq1—32 to 42 inches; extremely gravelly coarse sandy loam
Bq2—42 to 61 inches; extremely gravelly loamy coarse sand

3112—Stutler gravelly ashy loam, 0 to 15 percent slopes, extremely bouldery surface

Map Unit Setting

General landscape: Channeled scablands (fig. 10)
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,000 to 2,500 feet
Mean annual precipitation: 16 to 20 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Figure 10.—Typical area of Stutler gravelly ashy loam, 0 to 15 percent slopes, extremely bouldery surface, under a canopy of ponderosa pine.

Map Unit Composition

Stutler, extremely bouldery surface, and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Stutler, Extremely Bouldery Surface

Setting
Landform: Outwash terraces, outwash plains
Geomorphic position (three-dimensional): Treads, risers
Downslope shape: Linear
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 15 percent
Percentage of surface area covered with boulders: 3 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; gravelly ashy loam
Bw1—5 to 12 inches; cobbly ashy loam
Bw2—12 to 22 inches; extremely bouldery coarse sandy loam
Bw3—22 to 32 inches; extremely bouldery coarse sandy loam
Bq1—32 to 42 inches; extremely bouldery coarse sandy loam

3120—Marble loamy sand, 0 to 8 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 1,540 to 2,500 feet
Mean annual precipitation: 15 to 22 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Marble and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Marble

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy glaciofluvial deposits
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline

Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Land capability subclass (irrigated): 4e
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; loamy sand
E—4 to 8 inches; loamy sand
E and Bt1—8 to 27 inches; sand
E and Bt2—27 to 53 inches; sand
C—53 to 60 inches; sand

3126—Rock outcrop-Northstar complex, 15 to 30 percent slopes

Map Unit Setting

General landscape: Channeled scabland
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,800 to 2,500 feet
Mean annual precipitation: 15 to 19 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Rock outcrop: 40 percent
Northstar and similar soils: 35 percent
Dissimilar minor components: 25 percent

Characteristics of Rock Outcrop

Slope range: 15 to 30 percent
Land capability subclass (nonirrigated): 8

Characteristics of Northstar

Setting
Landform: Basalt plateaus
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Base slopes, side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): Southeast
Aspect (range): Northeast to north (clockwise)

Properties and qualities
Parent material: Loess with an influence of volcanic ash over colluvium and residuum derived from basalt
Slope range: 15 to 30 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 1.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 3 inches; moderately decomposed plant material
A1—3 to 6 inches; extremely cobbly ashy loam
A2—6 to 11 inches; extremely cobbly ashy loam
BA—11 to 17 inches; very gravelly ashy loam

2Bw—17 to 26 inches; extremely gravelly loam
2R—26 to 36 inches; bedrock

Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat excessively drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/bluebunch wheatgrass (CN130)

Typical profile
Ap—0 to 11 inches; ashy sandy loam
Bw—11 to 22 inches; sandy loam
BC—22 to 28 inches; gravelly coarse sandy loam
C—28 to 60 inches; coarse sand

Characteristics of Phoebe, Dry

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None

Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/bluebunch wheatgrass (CN130)

Typical profile
Ap—0 to 8 inches; ashy sandy loam
A—8 to 16 inches; ashy sandy loam
Bw1—16 to 25 inches; fine sandy loam
Bw2—25 to 34 inches; sandy loam
C1—34 to 44 inches; loamy sand
C2—44 to 60 inches; sand

Aspect (range): East to northeast (clockwise)

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 3 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Land capability subclass (irrigated): 4e
Forest Service habitat type: Douglas-fir/common snowberry (CN310)

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 7 inches; ashy sandy loam
Bw1—7 to 11 inches; ashy sandy loam
Bw2—11 to 22 inches; ashy sandy loam
C1—22 to 33 inches; loamy coarse sand
C2—33 to 45 inches; coarse sand
C3—45 to 60 inches; gravelly coarse sand

3202—Torboy-Blackprince complex, 8 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 1,800 to 2,900 feet
Mean annual precipitation: 21 to 30 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Torboy and similar soils: 55 percent
Blackprince and similar soils: 20 percent
Dissimilar minor components: 25 percent

Characteristics of Torboy

Setting
Landform: Hills, outwash terraces
Geomorphic position (two-dimensional): Footslopes
Geomorphic position (three-dimensional): Base slopes, risers
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): Southeast
Aspect (range): Northeast to west (clockwise)

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches

Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.1 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4s
Forest Service habitat type: Douglas-fir/common snowberry (CN310)

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 7 inches; fine gravelly ashy coarse sandy loam
Bw1—7 to 11 inches; fine gravelly ashy sandy loam
Bw2—11 to 22 inches; fine gravelly ashy sandy loam
C1—22 to 33 inches; fine gravelly loamy coarse sand
C2—33 to 45 inches; gravelly coarse sand
C3—45 to 60 inches; very gravelly coarse sand

Characteristics of Blackprince

Setting
Landform: Hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Interfluves, nose slopes, crests
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite
Slope range: 8 to 15 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; gravelly ashy coarse sandy loam
Bw—5 to 19 inches; very gravelly ashy sandy loam

Bt—19 to 26 inches; very gravelly coarse sandy loam
BCt—26 to 36 inches; very gravelly loamy coarse sand
Cr—36 inches; bedrock

3302—Scrabblers ashy fine sandy loam, 8 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 44A—Northern Rocky Mountain valleys
Elevation: 1,900 to 2,300 feet
Mean annual precipitation: 20 to 25 inches

Mean annual air temperature: 43 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Scrabblers and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Scrabblers

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Risers
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): Northeast
Aspect (range): Northwest to southeast (clockwise)

Properties and qualities
Parent material: Thin mantle of volcanic ash mixed with loess over outwash
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 5 inches; ashy fine sandy loam
A2—5 to 8 inches; ashy fine sandy loam
Bw1—8 to 12 inches; ashy fine sandy loam
2Bw2—12 to 23 inches; gravelly sandy loam
2C1—23 to 36 inches; loamy coarse sand
2C2—36 to 60 inches; gravelly coarse sand

Dissimilar Minor Components

A2—5 to 8 inches; ashy fine sandy loam
Bw1—8 to 12 inches; ashy fine sandy loam
2Bw2—12 to 23 inches; gravelly sandy loam
2C1—23 to 36 inches; loamy coarse sand
2C2—36 to 60 inches; gravelly coarse sand

Characteristics of Torboy

Setting
Landform: Outwash terraces
Geomorphic position (three-dimensional): Risers
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): Southeast
Aspect (range): Northeast to west (clockwise)

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 3 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.1 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4s
Forest Service habitat type: Douglas-fir/common snowberry (CN310)

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 7 inches; fine gravelly ashy coarse sandy loam
Bw1—7 to 11 inches; fine gravelly ashy sandy loam
Bw2—11 to 22 inches; fine gravelly ashy sandy loam
C1—22 to 33 inches; fine gravelly loamy coarse sand
C2—33 to 45 inches; gravelly coarse sand
C3—45 to 60 inches; very gravelly coarse sand

3504—Brincken ashy silt loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Channeled scablands
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,800 to 2,600 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 48 to 52 degrees F
Frost-free period: 110 to 140 days

Map Unit Composition

Brincken and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Brincken

Setting
Landform: Outwash terraces on loess hills
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over sandy and gravelly glaciofluvial deposits over older loess
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 8.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 7 inches; ashy silt loam
A—7 to 13 inches; ashy silt loam
AB—13 to 19 inches; ashy silt loam
Bw—19 to 29 inches; ashy silt loam
Bt1—29 to 41 inches; extremely gravelly loam
Bt2—41 to 57 inches; very gravelly sandy clay loam
2Btb—57 to 60 inches; silty clay loam

Dissimilar Minor Components

3505—Seaboldt, warm-Brincken, moist complex, 0 to 8 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys, Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,300 to 2,440 feet
Mean annual precipitation: 18 to 20 inches
Mean annual air temperature: 48 to 52 degrees F
Frost-free period: 110 to 140 days

Map Unit Composition

Seaboldt, warm, and similar soils: 60 percent
Brincken, moist, and similar soils: 25 percent
Dissimilar minor components: 15 percent

Characteristics of Seaboldt, Warm

Setting
Landform: Outwash plains on basalt plateaus
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over glaciofluvial deposits over residuum derived from basalt
Slope range: 0 to 8 percent

Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Ap1—0 to 7 inches; ashy loam
Ap2—7 to 10 inches; ashy loam
Bw1—10 to 16 inches; loam
2Bw2—16 to 23 inches; sandy loam
2C—23 to 28 inches; extremely gravelly sandy loam
3R—28 to 38 inches; bedrock

Characteristics of Brincken, Moist

Setting
Landform: Outwash terraces on loess hills

Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Ap—0 to 7 inches; ashy silt loam
A—7 to 13 inches; ashy silt loam
AB—13 to 19 inches; ashy silt loam
Bw—19 to 29 inches; ashy silt loam
Bt1—29 to 41 inches; extremely gravelly loam
Bt2—41 to 57 inches; very gravelly sandy clay loam
2Btb—57 to 60 inches; silty clay loam

Dissimilar Minor Components

Speigle soils
Percentage of map unit: 10 percent
Landform: Escarpments
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear

Dearyton soils
Percentage of map unit: 3 percent
Landform: Hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Convex

Rock outcrop
Percentage of map unit: 2 percent

4040—Wolfeson-Fan Lake complex, 0 to 8 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,000 to 2,300 feet
Mean annual precipitation: 22 to 26 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Wolfeson and similar soils: 60 percent
Fan Lake and similar soils: 25 percent
Dissimilar minor components: 15 percent

Characteristics of Wolfeson

Setting
Landform: Relict glacial lake terraces, outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over glaciofluvial and glaciolacustrine deposits
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 21 to 37 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 8.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3w
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Ap—0 to 9 inches; ashy fine sandy loam
Bw1—9 to 21 inches; ashy fine sandy loam
Bw2—21 to 37 inches; fine sandy loam
C1—37 to 48 inches; clay loam
C2—48 to 53 inches; silty clay loam
C3—53 to 60 inches; loamy fine sand

Characteristics of Fan Lake

Setting
Landform: Relict glacial lake terraces, outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Thin mantle of volcanic ash mixed with loess over glaciofluvial deposits or Latah Formation
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 16 to 24 inches, perched (see Water Features table)
Salinity (maximum): Not saline

Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.1 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4w
Forest Service habitat type: Grand fir/twinflower (CN590)

Typical profile
Ap—0 to 4 inches; ashy very fine sandy loam
AB—4 to 8 inches; ashy very fine sandy loam
Bw—8 to 16 inches; ashy fine sandy loam
2E—16 to 24 inches; fine sandy loam
2E/Bt—24 to 36 inches; loam
2Btx—36 to 51 inches; clay loam
3C1—51 to 57 inches; fine sandy loam
3C2—57 to 60 inches; sandy clay loam

Dissimilar Minor Components

Stapaloop soils
Percentage of map unit: 10 percent
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear

Bridgeson soils
Percentage of map unit: 5 percent
Landform: Drainageways
Geomorphic position (three-dimensional): Treads
Downslope shape: Concave
Across-slope shape: Concave

4041—Wolfeson ashy very fine sandy loam, 0 to 3 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain valleys
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,100 to 2,300 feet

5001—Brickel gravelly ashy silt loam, 15 to 30 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 4,800 to 5,890 feet
Mean annual precipitation: 40 to 50 inches
Mean annual air temperature: 38 to 44 degrees F
Frost-free period: 30 to 60 days

Map Unit Composition

Brickel and similar soils: 75 percent
Dissimilar minor components: 25 percent

Characteristics of Brickel

Setting
Landform: Mountains, ridges
Geomorphic position (two-dimensional): Backslopes, summits, shoulders
Geomorphic position (three-dimensional): Mountain flanks, mountaintops
Downslope shape: Linear, convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Northeast to northwest (clockwise)

Properties and qualities
Parent material: Thick mantle of volcanic ash over gneiss or granite
Slope range: 15 to 30 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6c
Forest Service habitat type: Subalpine fir/beargrass (CN690)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; gravelly ashy silt loam
A2—3 to 9 inches; gravelly ashy silt loam
Bw1—9 to 19 inches; very gravelly ashy silt loam
Bw2—19 to 27 inches; very gravelly ashy silt loam
Bw3—27 to 31 inches; very cobbly ashy very fine sandy loam
2R—31 to 41 inches; bedrock

Dissimilar Minor Components

Vaywood soils
Percentage of map unit: 13 percent
Landform: Ridges, mountains

Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Mountaintops, mountain flanks
Downslope shape: Convex
Across-slope shape: Linear

Bouldercreek soils
Percentage of map unit: 5 percent
Landform: Mountains
Geomorphic position (two-dimensional): Footslopes, backslopes
Geomorphic position (three-dimensional): Mountain bases, mountain flanks
Downslope shape: Linear
Across-slope shape: Linear

Brevco soils
Percentage of map unit: 5 percent
Landform: Mountains
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Mountaintops

Across-slope shape: Convex

Rock outcrop
Percentage of map unit: 2 percent

5023—Micapeak-Rock outcrop complex, 8 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,170 to 3,660 feet
Mean annual precipitation: 20 to 25 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Micapeak and similar soils: 55 percent
Rock outcrop: 20 percent
Dissimilar minor components: 25 percent

Characteristics of Micapeak

Setting
Landform: Ridges, hills
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Interfluves, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): Northeast
Aspect (range): West to southeast (clockwise)

Properties and qualities
Parent material: Colluvium and residuum derived from granite, gneiss, and schist with an influence of volcanic ash and loess in the upper part
Slope range: 8 to 15 percent

Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 7 inches; gravelly ashy loam
Bw1—7 to 13 inches; gravelly ashy loam
Bw2—13 to 22 inches; gravelly loam
BCt—22 to 33 inches; gravelly loam
C—33 to 39 inches; gravelly sandy loam
Cr—39 to 49 inches; bedrock

Characteristics of Rock Outcrop

Slope range: 8 to 15 percent
Land capability subclass (nonirrigated): 8

Frost-free period: 90 to 130 days

Map Unit Composition

Micapeak and similar soils: 40 percent
Spokane and similar soils: 30 percent
Dissimilar minor components: 30 percent

Characteristics of Micapeak

Setting
Landform: Hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Convex

Across-slope shape: Convex
Aspect (representative): Southeast
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Colluvium and residuum derived from granite, gneiss, and schist with an influence of volcanic ash and loess in the upper part
Slope range: 30 to 55 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 7 inches; gravelly ashy loam
Bw1—7 to 13 inches; gravelly ashy loam
Bw2—13 to 22 inches; gravelly loam
BCt—22 to 33 inches; gravelly loam
C—33 to 39 inches; gravelly sandy loam
Cr—39 to 49 inches; bedrock

Characteristics of Spokane

Setting
Landform: Hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Side slopes, nose slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, gneiss, or schist
Slope range: 30 to 55 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; ashy loam
A2—4 to 10 inches; ashy sandy loam
Bt—10 to 18 inches; gravelly coarse sandy loam
BCt—18 to 26 inches; gravelly coarse sandy loam
Cr—26 to 36 inches; bedrock

Dissimilar Minor Components

5040—Spokane-Swakane complex, 3 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 1,900 to 3,300 feet
Mean annual precipitation: 17 to 23 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Spokane and similar soils: 40 percent
Swakane and similar soils: 35 percent
Dissimilar minor components: 25 percent

Characteristics of Spokane

Setting
Landform: Ridges on mountains, hills
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Interfluves, side slopes, nose slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, gneiss, or schist
Slope range: 3 to 15 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock

Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; ashy loam
A2—4 to 10 inches; ashy sandy loam
Bt—10 to 18 inches; gravelly coarse sandy loam
BCt—18 to 26 inches; gravelly coarse sandy loam
Cr—26 to 36 inches; bedrock

Characteristics of Swakane

Setting
Landform: Ridges, mountains, hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Interfluves, nose slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, schist, or gneiss
Slope range: 3 to 15 percent
Depth to restrictive feature: 10 to 20 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 1.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6s
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly ashy loam
AB—3 to 9 inches; gravelly ashy loam
Bw—9 to 13 inches; very cobbly ashy sandy loam
C1—13 to 17 inches; very gravelly sandy loam
C2—17 to 19 inches; very gravelly loamy sand
R—19 to 29 inches; bedrock

Dissimilar Minor Components

Kramerhill soils

5053—Jacot, dry-Micapeak complex, 30 to 55 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,300 to 4,200 feet
Mean annual precipitation: 25 to 40 inches
Mean annual air temperature: 41 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Jacot, dry, and similar soils: 40 percent
Micapeak and similar soils: 25 percent
Dissimilar minor components: 35 percent

Characteristics of Jacot, Dry

Setting
Landform: Hills, mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks, base slopes, interfluves
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): Southwest
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and quartz-monzonite
Slope range: 30 to 55 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Grand fir/queencup beadlily (CN520)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 3 inches; moderately decomposed plant material
A—3 to 10 inches; ashy silt loam
Bw—10 to 18 inches; ashy silt loam
2Bt1—18 to 24 inches; gravelly sandy loam
2Bt2—24 to 39 inches; gravelly sandy loam
2BC—39 to 50 inches; gravelly sandy loam
2C1—50 to 59 inches; fine gravelly loamy sand
2C2—59 to 62 inches; fine gravelly loamy sand

Characteristics of Micapeak

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Mountain flanks, side slopes

Geomorphic position (three-dimensional): Mountain bases, mountain flanks, side slopes
Downslope shape: Linear, convex
Across-slope shape: Linear, convex

Kruse soils
Percentage of map unit: 10 percent
Landform: Hills
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Side slopes, interfluves
Downslope shape: Linear
Across-slope shape: Concave

Nakarna soils, dry
Percentage of map unit: 10 percent
Landform: Hills, mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks, side slopes
Downslope shape: Convex
Across-slope shape: Convex

Quinnamose soils
Percentage of map unit: 5 percent
Landform: Hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Concave

5067—Quinnamose-Micapeak complex, 15 to 30 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,000 to 3,600 feet
Mean annual precipitation: 22 to 35 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Quinnamose and similar soils: 40 percent
Micapeak and similar soils: 30 percent
Dissimilar minor components: 30 percent

Characteristics of Quinnamose

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks, side slopes
Downslope shape: Linear
Across-slope shape: Concave
Aspect (representative): Southeast
Aspect (range): Northeast to north (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite and schist
Slope range: 15 to 30 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 3 inches; moderately decomposed plant material
A—3 to 9 inches; ashy loam
BA—9 to 12 inches; ashy sandy loam
Bw1—12 to 31 inches; sandy loam
Bw2—31 to 51 inches; paragravelly sandy loam
BC—51 to 58 inches; very paragravelly sandy loam
Cr—58 to 68 inches; bedrock

Characteristics of Micapeak

Setting
Landform: Mountains, ridges, hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Mountain flanks, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Properties and qualities
Parent material: Colluvium and residuum derived from granite, gneiss, and schist with an influence of volcanic ash and loess in the upper part
Slope range: 15 to 30 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained

Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 7 inches; gravelly ashy loam
Bw1—7 to 13 inches; gravelly ashy loam
Bw2—13 to 22 inches; gravelly loam
BCt—22 to 33 inches; gravelly loam
C—33 to 39 inches; gravelly sandy loam
Cr—39 to 49 inches; bedrock

Dissimilar Minor Components

Blackprince soils
Percentage of map unit: 10 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Shoulders
Geomorphic position (three-dimensional): Mountain flanks, nose slopes
Downslope shape: Convex
Across-slope shape: Convex

Jacot soils, dry
Percentage of map unit: 10 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Summits, footslopes
Geomorphic position (three-dimensional): Mountain flanks, base slopes, interfluves
Downslope shape: Convex
Across-slope shape: Convex

Kruse soils
Percentage of map unit: 10 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Lower third of mountain flanks, side slopes, interfluves
Downslope shape: Linear
Across-slope shape: Linear, convex

5068—Quinnamose-Micapeak complex, 30 to 55 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,000 to 3,800 feet
Mean annual precipitation: 22 to 35 inches

Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

5070—Lenz-Spokane complex, 3 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain foothills (fig. 11)
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 1,700 to 3,600 feet
Mean annual precipitation: 18 to 28 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Lenz and similar soils: 45 percent
Spokane and similar soils: 35 percent
Dissimilar minor components: 20 percent

Characteristics of Lenz

Setting
Landform: Hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Nose slopes, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Figure 11.—Typical area of Lenz-Spokane complex, 3 to 15 percent slopes. These soils support a ponderosa pine/common snowberry habitat type.

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from gneiss, schist, and granite
Slope range: 3 to 15 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; very gravelly ashy sandy loam
A2—4 to 9 inches; very gravelly ashy sandy loam
Bw1—9 to 14 inches; very gravelly ashy sandy loam
Bw2—14 to 26 inches; very cobbly sandy loam
C—26 to 38 inches; extremely stony sandy loam
R—38 to 48 inches; bedrock

Characteristics of Spokane

Setting
Landform: Hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Side slopes, nose slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): East to northwest (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, gneiss, or schist
Slope range: 3 to 15 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material

A1—1 to 4 inches; ashy loam
A2—4 to 10 inches; ashy sandy loam
Bt—10 to 18 inches; gravelly coarse sandy loam
BCt—18 to 26 inches; gravelly coarse sandy loam
Cr—26 to 36 inches; bedrock

Dissimilar Minor Components

5080—Vaywood medial silt loam, 15 to 30 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 4,400 to 5,850 feet
Mean annual precipitation: 40 to 50 inches
Mean annual air temperature: 38 to 41 degrees F
Frost-free period: 30 to 60 days

Map Unit Composition

Vaywood and similar soils: 75 percent
Dissimilar minor components: 25 percent

Characteristics of Vaywood

Setting
Landform: Ridges, mountains
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Mountaintops, mountain flanks
Downslope shape: Convex
Across-slope shape: Linear
Aspect (representative): North
Aspect (range): Northwest to south (clockwise)

Properties and qualities
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and gneiss
Slope range: 15 to 30 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6c
Forest Service habitat type: Subalpine fir/queencup beadlily (CN620)

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 8 inches; medial silt loam
Bw1—8 to 20 inches; medial silt loam
Bw2—20 to 24 inches; gravelly medial silt loam
2Bw3—24 to 36 inches; very cobbly sandy loam
2BCt—36 to 44 inches; extremely stony sandy loam
2C1—44 to 50 inches; extremely stony loamy sand
2C2—50 to 60 inches; extremely stony loamy sand

Rock outcrop
Percentage of map unit: 5 percent

5081—Vaywood medial silt loam, 30 to 60 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 4,400 to 5,850 feet
Mean annual precipitation: 40 to 50 inches
Mean annual air temperature: 38 to 41 degrees F
Frost-free period: 30 to 60 days

Map Unit Composition

Vaywood and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Vaywood

Setting
Landform: Ridges, mountains
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Mountaintops, mountain flanks
Downslope shape: Convex
Across-slope shape: Linear
Aspect (representative): North
Aspect (range): Northwest to south (clockwise)

Properties and qualities
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and gneiss
Slope range: 30 to 60 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Subalpine fir/queencup beadlily (CN620)

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 8 inches; medial silt loam
Bw1—8 to 20 inches; medial silt loam
Bw2—20 to 24 inches; gravelly medial silt loam
2Bw3—24 to 36 inches; very cobbly sandy loam
2BCt—36 to 44 inches; extremely stony sandy loam
2C1—44 to 50 inches; extremely stony loamy sand
2C2—50 to 60 inches; extremely stony loamy sand

5090—Brevco-Ardtoo complex, 3 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,000 to 4,800 feet
Mean annual precipitation: 25 to 35 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Brevco and similar soils: 50 percent
Ardtoo and similar soils: 25 percent
Dissimilar minor components: 25 percent

Characteristics of Brevco

Setting
Landform: Hills, mountains
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Mountaintops, crests, interfluves, nose slopes
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite
Slope range: 3 to 15 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6s
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly ashy sandy loam
AB—4 to 8 inches; gravelly ashy sandy loam
Bw—8 to 14 inches; very gravelly ashy coarse sandy loam
BC—14 to 21 inches; very gravelly coarse sandy loam

C—21 to 37 inches; extremely gravelly coarse sandy loam
R—37 to 47 inches; bedrock

Characteristics of Ardtoo

Setting
Landform: Mountains, hills

Aspect (range): West to southeast (clockwise)

Properties and qualities
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from gneiss and other granitic rock
Slope range: 15 to 30 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Grand fir/queencup beadlily (CN520)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 7 inches; ashy silt loam
Bw1—7 to 17 inches; ashy silt loam
2Bw2—17 to 29 inches; very cobbly sandy loam
2BC—29 to 36 inches; very gravelly sandy loam
2C—36 to 44 inches; very gravelly loamy coarse sand
2Cr—44 to 54 inches; bedrock

Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; ashy silt loam
Bw1—5 to 11 inches; ashy silt loam
Bw2—11 to 17 inches; gravelly ashy silt loam
2Bw3—17 to 23 inches; very gravelly sandy loam
2BC—23 to 45 inches; very cobbly sandy loam
2C—45 to 63 inches; extremely cobbly loamy sand
2R—63 to 73 inches; bedrock

Characteristics of Brevco

Setting
Landform: Hills, mountains
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Mountain flanks, crests, nose slopes
Downslope shape: Linear, convex
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite
Slope range: 15 to 30 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): High
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly ashy sandy loam
AB—4 to 8 inches; gravelly ashy sandy loam
Bw—8 to 14 inches; very gravelly ashy coarse sandy loam
BC—14 to 21 inches; very gravelly coarse sandy loam
C—21 to 37 inches; extremely gravelly coarse sandy loam
R—37 to 47 inches; bedrock

A—3 to 10 inches; ashy silt loam
Bw—10 to 18 inches; ashy silt loam
2Bt1—18 to 24 inches; gravelly sandy loam
2Bt2—24 to 39 inches; gravelly sandy loam
2BC—39 to 50 inches; gravelly sandy loam
2C1—50 to 59 inches; fine gravelly loamy sand
2C2—59 to 62 inches; fine gravelly loamy sand

Characteristics of Hysing, Dry

Setting
Landform: Hills, mountains
Geomorphic position (two-dimensional): Summits, footslopes
Geomorphic position (three-dimensional): Mountaintops, mountain bases, interfluves, base slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): Southeast
Aspect (range): East to southwest (clockwise)

Properties and qualities
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and quartz-monzonite
Slope range: 15 to 30 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Grand fir/queencup beadlily (CN520)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; ashy silt loam
Bw1—6 to 18 inches; ashy silt loam
Bw2—18 to 28 inches; ashy silt loam
2BC—28 to 31 inches; very gravelly sandy loam
2C—31 to 47 inches; very gravelly coarse sand
2Cr—47 to 57 inches; bedrock

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over glaciofluvial deposits
Slope range: 8 to 25 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 10.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/bluebunch wheatgrass (CN130)

Typical profile
Ap1—0 to 4 inches; ashy silt loam
Ap2—4 to 10 inches; ashy silt loam
A—10 to 18 inches; ashy loam
2Bt1—18 to 32 inches; loam
2Bt2—32 to 42 inches; loam
2C—42 to 60 inches; very fine sandy loam

Characteristics of Skalan

Setting
Landform: Hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Side slopes, interfluves
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, gneiss, or schist
Slope range: 8 to 25 percent
Depth to restrictive feature: 20 to 36 inches to paralithic bedrock (where present), 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 9 inches; gravelly ashy loam
BA—9 to 16 inches; gravelly ashy loam
Bt1—16 to 23 inches; very gravelly clay loam
Bt2—23 to 31 inches; very gravelly loam
Cr—31 to 36 inches; bedrock
R—36 to 46 inches; bedrock

5322—Kramerhill-Skalan complex, 15 to 40 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,200 to 3,000 feet
Mean annual precipitation: 18 to 23 inches
Mean annual air temperature: 45 to 49 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Kramerhill and similar soils: 55 percent
Skalan and similar soils: 20 percent
Dissimilar minor components: 25 percent

Characteristics of Kramerhill

Setting
Landform: Hills
Geomorphic position (two-dimensional): Summits, footslopes
Geomorphic position (three-dimensional): Base slopes, interfluves
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): Southeast
Aspect (range): East to southwest (clockwise)

Properties and qualities
Parent material: Colluvium and residuum derived from saprolitic gneiss, quartzite, and Latah Formation mixed with loess and volcanic ash in the upper part
Slope range: 15 to 40 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline

Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Ponderosa pine/ninebark (CN190)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 5 inches; ashy loam
A2—5 to 9 inches; ashy loam
BE—9 to 19 inches; gravelly loam
Bt1—19 to 30 inches; gravelly sandy clay loam
Bt2—30 to 46 inches; gravelly sandy clay loam
Cr—46 to 56 inches; bedrock

Characteristics of Skalan

Setting
Landform: Ridges, hills
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Interfluves, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, gneiss, or schist

5512—Santa ashy silt loam, 8 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain foothills (fig. 15)
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,510 to 3,200 feet
Mean annual precipitation: 25 to 37 inches
Mean annual air temperature: 43 to 46 degrees F
Frost-free period: 105 to 120 days

Map Unit Composition

Santa and similar soils: 80 percent
Dissimilar minor components: 20 percent

Figure 15.—Typical area of Santa ashy silt loam, 8 to 15 percent slopes, under oats. In uncultivated areas, the Santa soil supports a grand fir/mallow ninebark habitat type.

Characteristics of Santa

Setting
Landform: Hills
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Interfluves, side slopes
Downslope shape: Convex, concave
Across-slope shape: Linear, convex
Aspect (range): All aspects

Properties and qualities
Parent material: Loess with an influence of volcanic ash in the upper part
Slope range: 8 to 15 percent
Depth to restrictive feature: 20 to 40 inches to a fragipan
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 8 to 22 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Ap—0 to 8 inches; ashy silt loam
Bw—8 to 19 inches; silt loam
E—19 to 29 inches; silt loam
Btxb1—29 to 38 inches; silt loam
Btxb2—38 to 59 inches; silt loam

5602—Lakestarr-Santa complex, 8 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,350 to 3,100 feet
Mean annual precipitation: 28 to 35 inches
Mean annual air temperature: 41 to 45 degrees F
Frost-free period: 60 to 120 days

Map Unit Composition

Lakestarr and similar soils: 40 percent
Santa and similar soils: 30 percent
Dissimilar minor components: 30 percent

Characteristics of Lakestarr

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Mountain bases, base slopes, side slopes
Downslope shape: Linear
Across-slope shape: Concave

Aspect (representative): Northwest
Aspect (range): Northwest to northeast (clockwise)

Properties and qualities
Parent material: Thin mantle of volcanic ash and loess over colluvium derived from pre-Tertiary felsic gneiss, schist, and till
Slope range: 8 to 15 percent
Depth to restrictive feature: 40 to 60 inches to densic material
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Very low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 15 to 20 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 9.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Western hemlock/queencup beadlily (CN570)

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 10 inches; ashy silt loam
Bw—10 to 15 inches; ashy silt loam
2E/Bt—15 to 24 inches; silt loam
2Btc—24 to 39 inches; loam
2E/Btxc—39 to 47 inches; loam
3Cdc1—47 to 55 inches; loam
3Cdc2—55 to 65 inches; sandy clay loam

Characteristics of Santa

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Side slopes, interfluves
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): Southeast
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess with an influence of volcanic ash in the upper part
Slope range: 8 to 15 percent
Depth to restrictive feature: 20 to 40 inches to a fragipan
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 16 to 25 inches, perched (see Water Features table)

Downslope shape: Linear
Across-slope shape: Concave

5603—Lakestarr-Santa complex, 15 to 30 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,350 to 3,100 feet
Mean annual precipitation: 25 to 35 inches
Mean annual air temperature: 41 to 45 degrees F
Frost-free period: 60 to 120 days

Map Unit Composition

Lakestarr and similar soils: 40 percent
Santa and similar soils: 25 percent
Dissimilar minor components: 35 percent

Characteristics of Lakestarr

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Mountain bases, base slopes, side slopes
Downslope shape: Linear
Across-slope shape: Concave
Aspect (representative): Northwest
Aspect (range): Northwest to northeast (clockwise)

Properties and qualities
Parent material: Thin mantle of volcanic ash and loess over colluvium derived from pre-Tertiary felsic gneiss, schist, and till
Slope range: 15 to 30 percent
Depth to restrictive feature: 40 to 60 inches to densic material
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Very low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 15 to 20 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 9.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Western hemlock/queencup beadlily (CN570)

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 10 inches; ashy silt loam
Bw—10 to 15 inches; ashy silt loam
2E/Bt—15 to 24 inches; silt loam
2Btc—24 to 39 inches; loam
2E/Btx—39 to 47 inches; loam
3Cdc1—47 to 55 inches; loam
3Cdc2—55 to 65 inches; sandy clay loam

Characteristics of Santa

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): Southwest
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess with an influence of volcanic ash in the upper part
Slope range: 15 to 30 percent
Depth to restrictive feature: 20 to 40 inches to a fragipan
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 16 to 25 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A1—1 to 5 inches; ashy silt loam
A2—5 to 9 inches; ashy silt loam
Bw—9 to 16 inches; silt loam
EB—16 to 25 inches; silt loam
E—25 to 27 inches; silt
Btx/Ex—27 to 39 inches; silty clay loam
Btx—39 to 65 inches; silty clay loam

Dissimilar Minor Components

Keeler soils
Percentage of map unit: 10 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Mountain bases, side slopes

Kruse soils
Percentage of map unit: 10 percent
Landform: Hills, mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes, nose slopes
Downslope shape: Linear
Across-slope shape: Convex

Bouldercreek soils
Percentage of map unit: 5 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Mountain bases, mountain flanks
Downslope shape: Linear
Across-slope shape: Linear

Lakestarr soils, dry
Percentage of map unit: 5 percent
Landform: Hills
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Base slopes, side slopes
Downslope shape: Linear
Across-slope shape: Concave

Taney soils
Percentage of map unit: 5 percent
Landform: Loess hills on Columbia basalt plateaus
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Interfluves, side slopes
Downslope shape: Linear, concave
Across-slope shape: Linear

6001—Athena silt loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Channeled scablands
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,100 to 2,750 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 48 to 50 degrees F
Frost-free period: 110 to 140 days

Map Unit Composition

Athena and similar soils: 85 percent
Dissimilar minor components: 15 percent

Characteristics of Athena

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, footslopes
Geomorphic position (three-dimensional): Interfluves, base slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None

Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 12 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 4 inches; silt loam
A1—4 to 8 inches; silt loam
A2—8 to 13 inches; silt loam
ABt—13 to 26 inches; silt loam
Bt1—26 to 42 inches; silt loam
Bt2—42 to 54 inches; silt loam
Bt3—54 to 60 inches; silt loam

6003—Athena-Lance complex, 15 to 30 percent slopes

Map Unit Setting

General landscape: Channeled scablands (fig. 16)
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,200 to 2,750 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 48 to 52 degrees F
Frost-free period: 110 to 140 days

Map Unit Composition

Athena and similar soils: 55 percent
Lance and similar soils: 25 percent
Dissimilar minor components: 20 percent

Figure 16.—Typical area of Athena-Lance complex, 15 to 30 percent slopes, under small grain.

Characteristics of Athena

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess
Slope range: 15 to 30 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 12 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 4 inches; silt loam
A1—4 to 8 inches; silt loam
A2—8 to 13 inches; silt loam
ABt—13 to 26 inches; silt loam
Bt1—26 to 42 inches; silt loam
Bt2—42 to 54 inches; silt loam
Bt3—54 to 60 inches; silt loam

Characteristics of Lance

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Nose slopes, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): East to southwest (clockwise)

Properties and qualities
Parent material: Recent loess over older loess
Slope range: 15 to 30 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 10.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 9 inches; silt loam
Bkq1—9 to 14 inches; extremely parachannery silt loam
Bkq2—14 to 22 inches; very parachannery silt loam
Bkq3—22 to 40 inches; silt loam

Frost-free period: 110 to 150 days

Map Unit Composition

Garfield and similar soils: 40 percent
Naff and similar soils: 35 percent
Dissimilar minor components: 25 percent

Characteristics of Garfield

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Interfluves, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): North to northwest (clockwise)

Properties and qualities
Parent material: Recent loess over older loess
Slope range: 8 to 35 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap1—0 to 5 inches; silt loam
Ap2—5 to 8 inches; silt loam
Btb1—8 to 19 inches; silty clay loam

Btb2—19 to 32 inches; silty clay
Btb3—32 to 45 inches; silty clay loam
Btb4—45 to 60 inches; silty clay loam

Characteristics of Naff

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): South
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess
Slope range: 8 to 35 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 16 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 8 inches; silt loam
A—8 to 17 inches; silt loam
BA—17 to 26 inches; silt loam
Bt1—26 to 61 inches; silty clay loam
Bt2—61 to 80 inches; silty clay loam

Dissimilar Minor Components

Athena soils
Percentage of map unit: 10 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear

Thatuna soils
Percentage of map unit: 10 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Base slopes, side slopes
Downslope shape: Linear
Across-slope shape: Concave

Staley soils
Percentage of map unit: 5 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Interfluves, nose slopes, side slopes
Downslope shape: Convex
Across-slope shape: Convex

6031—Staley-Naff complex, 8 to 25 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,400 to 2,640 feet
Mean annual precipitation: 18 to 20 inches
Mean annual air temperature: 47 to 50 degrees F
Frost-free period: 110 to 150 days

Map Unit Composition

Staley and similar soils: 60 percent
Naff and similar soils: 25 percent
Dissimilar minor components: 15 percent

Characteristics of Staley

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Interfluves, nose slopes, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess
Slope range: 8 to 25 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 7 inches; silt loam
A—7 to 12 inches; silt loam

Bw—12 to 23 inches; silt loam
Bk1—23 to 37 inches; silt loam
Bk2—37 to 60 inches; silt loam

Characteristics of Naff

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): Southwest
Aspect (range): East to northwest (clockwise)

Properties and qualities
Parent material: Loess
Slope range: 8 to 25 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 16 inches)

Interpretive groups

6040—Larkin silt loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus (fig. 18)
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,400 to 2,750 feet
Mean annual precipitation: 19 to 24 inches
Mean annual air temperature: 45 to 48 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Larkin and similar soils: 70 percent
Dissimilar minor components: 30 percent

Figure 18.—Typical area of Larkin silt loam, 0 to 8 percent slopes, under small grain stubble. In uncultivated areas, the Larkin soil supports a ponderosa pine/common snowberry habitat type.

Characteristics of Larkin

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): South
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Loess
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 4 inches; silt loam
A—4 to 9 inches; silt loam
AB—9 to 14 inches; silt loam
Bt1—14 to 19 inches; silt loam
Bt2—19 to 34 inches; silty clay loam
Bt3—34 to 64 inches; silty clay loam

Dissimilar Minor Components

Freeman soils
Percentage of map unit: 13 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, backslopes
Geomorphic position (three-dimensional): Side slopes, interfluves
Downslope shape: Linear
Across-slope shape: Linear

Driscoll soils
Percentage of map unit: 5 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Convex
Across-slope shape: Convex

Glenrose soils
Percentage of map unit: 5 percent
Landform: Hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Side slopes, nose slopes
Downslope shape: Convex
Across-slope shape: Convex

Southwick soils
Percentage of map unit: 5 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Concave
Across-slope shape: Concave

Caldwell soils
Percentage of map unit: 2 percent
Landform: Drainageways
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave

6041—Larkin-Southwick complex, 8 to 15 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,400 to 2,950 feet
Mean annual precipitation: 20 to 24 inches
Mean annual air temperature: 45 to 48 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Larkin and similar soils: 65 percent
Southwick and similar soils: 15 percent
Dissimilar minor components: 20 percent

Characteristics of Larkin

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): South
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Loess
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None

Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 4 inches; silt loam
A—4 to 9 inches; silt loam
AB—9 to 14 inches; silt loam
Bt1—14 to 19 inches; silt loam
Bt2—19 to 34 inches; silty clay loam
Bt3—34 to 64 inches; silty clay loam

Characteristics of Southwick

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Concave
Aspect (representative): North
Aspect (range): Northwest to southeast (clockwise)

Properties and qualities
Parent material: Loess with an influence of volcanic ash in the upper part over older loess
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 24 to 32 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/ninebark (CN190)

Typical profile
Ap1—0 to 6 inches; ashy silt loam
Ap2—6 to 14 inches; ashy silt loam
Bw—14 to 22 inches; silt loam
EB—22 to 27 inches; silt loam
Ec—27 to 32 inches; silt loam
Btcxb1—32 to 36 inches; silty clay loam
Btcb2—36 to 48 inches; silty clay loam
Btb3—48 to 60 inches; silt loam

Characteristics of Latah

Setting
Landform: Low stream terraces, drainageways
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear, concave
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from loess
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Low
Flooding frequency: Occasional (see Water Features table)
Ponding frequency: None
Seasonal high water table (minimum depth): About 18 to 22 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 10.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3w
Ecological site: WET MEADOW 16-24 PZ (R009XY601WA)

Typical profile
Ap—0 to 10 inches; silt loam
A—10 to 14 inches; silt loam
BA—14 to 19 inches; silt loam
E—19 to 22 inches; silt loam
Btgb1—22 to 31 inches; silty clay loam

Btgb2—31 to 38 inches; silty clay loam
Btb—38 to 60 inches; silty clay loam

Downslope shape: Linear
Across-slope shape: Linear

6093—Reardan silt loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,200 to 2,800 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Map Unit Composition

Reardan and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Reardan

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, footslopes
Geomorphic position (three-dimensional): Base slopes, interfluves
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Recent loess over older loess
Slope range: 0 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
A—0 to 10 inches; silt loam
Bw—10 to 15 inches; silt loam
E—15 to 18 inches; silt loam
Btb—18 to 31 inches; silty clay
Btkb—31 to 37 inches; silty clay loam
Bkqb—37 to 60 inches; silt loam

Dissimilar Minor Components

Athena soils
Percentage of map unit: 5 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, footslopes
Geomorphic position (three-dimensional): Interfluves, base slopes

6140—Driscoll silt loam, 0 to 8 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus (fig. 19)
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,380 to 2,700 feet
Mean annual precipitation: 20 to 24 inches
Mean annual air temperature: 45 to 48 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Driscoll and similar soils: 70 percent
Dissimilar minor components: 30 percent

Characteristics of Driscoll

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Base slopes, interfluves

Figure 19.—Typical area of Driscoll silt loam, 0 to 8 percent slopes, under small grain stubble. In uncultivated areas, the Driscoll soil supports a ponderosa pine/common snowberry habitat type.

Downslope shape: Convex
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Younger loess over older loess
Slope range: 0 to 8 percent
Depth to restrictive feature: 25 to 35 inches to an abrupt textural change
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 21 to 28 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 10.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3w
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap1—0 to 3 inches; silt loam
Ap2—3 to 10 inches; silt loam

6141—Driscoll-Larkin complex, 8 to 15 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,400 to 2,900 feet
Mean annual precipitation: 20 to 24 inches
Mean annual air temperature: 45 to 48 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Driscoll and similar soils: 45 percent
Larkin and similar soils: 30 percent
Dissimilar minor components: 25 percent

Characteristics of Driscoll

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Side slopes, interfluves
Downslope shape: Convex
Across-slope shape: Convex
Aspect (range): All aspects

Properties and qualities
Parent material: Younger loess over older loess
Slope range: 8 to 15 percent
Depth to restrictive feature: 25 to 35 inches to an abrupt textural change
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 21 to 28 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 10.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap1—0 to 3 inches; silt loam
Ap2—3 to 10 inches; silt loam
Bt—10 to 26 inches; silt loam
E—26 to 27 inches; silt loam
Btb1—27 to 37 inches; silty clay loam
Btb2—37 to 45 inches; silty clay loam
Btb/Eb—45 to 50 inches; silty clay loam
Btb3—50 to 60 inches; silty clay loam

Characteristics of Larkin

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Linear
Aspect (representative): South
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Loess
Slope range: 8 to 15 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches

Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
Ap—0 to 4 inches; silt loam
A—4 to 9 inches; silt loam
AB—9 to 14 inches; silt loam
Bt1—14 to 19 inches; silt loam
Bt2—19 to 34 inches; silty clay loam
Bt3—34 to 64 inches; silty clay loam

6200—Morical ashy silt loam, 0 to 15 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountain foothills
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,500 to 2,950 feet
Mean annual precipitation: 15 to 18 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Map Unit Composition

Morical and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Morical

Setting
Landform: Hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Crests, nose slopes, interfluves
Downslope shape: Convex
Across-slope shape: Linear
Aspect (representative): South
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite and quartzite
Slope range: 0 to 15 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Ecological site: LOAMY 16-24 PZ (R009XY102WA)

Typical profile
Ap—0 to 6 inches; ashy silt loam
AB—6 to 12 inches; ashy silt loam
2Bt1—12 to 18 inches; silt loam
2Bt2—18 to 27 inches; very paragravelly sandy clay loam
2Cr—27 to 37 inches; bedrock

7090—Urban land-Lenz, disturbed complex, 3 to 15 percent slopes

Map Unit Setting

Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 1,940 to 2,600 feet
Mean annual precipitation: 18 to 20 inches
Mean annual air temperature: 46 to 49 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Urban land: 70 percent
Lenz, disturbed, and similar soils: 20 percent
Dissimilar minor components: 10 percent

Characteristics of Urban Land

Slope range: 3 to 15 percent
Land capability subclass (nonirrigated): 8

Characteristics of Lenz, Disturbed

Setting
Landform: Hills
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Nose slopes, side slopes
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from gneiss, schist, and granite
Slope range: 3 to 15 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
A1—0 to 4 inches; very gravelly ashy sandy loam
A2—4 to 9 inches; very gravelly ashy sandy loam
Bw1—9 to 14 inches; very gravelly ashy sandy loam
Bw2—14 to 26 inches; very cobbly sandy loam
C—26 to 38 inches; extremely stony sandy loam
R—38 to 48 inches; bedrock

Setting
Landform: Outwash plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 3 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 4.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4s
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Ap—0 to 7 inches; very gravelly ashy loam
A1—7 to 13 inches; extremely gravelly ashy loam
A2—13 to 19 inches; extremely gravelly ashy loam
Bw1—19 to 33 inches; extremely gravelly loam
Bw2—33 to 43 inches; extremely gravelly loam

Bq—43 to 53 inches; extremely gravelly loamy coarse sand
BCk—53 to 60 inches; extremely gravelly coarse sand

Dissimilar Minor Components

7134—Urban land-Northstar, disturbed complex, 15 to 30 percent slopes

Map Unit Setting

Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 1,800 to 2,360 feet
Mean annual precipitation: 17 to 19 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Urban land: 60 percent
Northstar, disturbed, and similar soils: 25 percent
Dissimilar minor components: 15 percent

Characteristics of Urban Land

Slope range: 15 to 30 percent
Land capability subclass (nonirrigated): 8

Characteristics of Northstar, Disturbed

Setting
Landform: Basalt plateaus
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Base slopes, side slopes
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess with an influence of volcanic ash over colluvium and residuum derived from basalt
Slope range: 15 to 30 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 1.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7s
Forest Service habitat type: Ponderosa pine/common snowberry (CN170)

Typical profile
A1—0 to 6 inches; extremely cobbly ashy loam
A2—6 to 11 inches; extremely cobbly ashy loam
BA—11 to 17 inches; very gravelly ashy loam
2Bw—17 to 26 inches; extremely gravelly loam
2R—26 to 36 inches; bedrock

Available water capacity (entire profile): Low (about 4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Ap1—0 to 7 inches; ashy loam
Ap2—7 to 10 inches; ashy loam
Bw1—10 to 16 inches; loam
2Bw2—16 to 23 inches; sandy loam
2C—23 to 28 inches; extremely gravelly sandy loam
3R—28 to 38 inches; bedrock

Characteristics of Brincken, Moist, Disturbed

Setting
Landform: Outwash terraces on loess hills
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Loess mixed with a minor amount of volcanic ash over sandy and gravelly glaciofluvial deposits over older loess
Slope range: 3 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately low
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 8.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 2e
Forest Service habitat type: Ponderosa pine/Idaho fescue (CN140)

Typical profile
Ap—0 to 7 inches; ashy silt loam
A—7 to 13 inches; ashy silt loam
AB—13 to 19 inches; ashy silt loam
Bw—19 to 29 inches; ashy silt loam

Bt1—29 to 41 inches; extremely gravelly loam
Bt2—41 to 57 inches; very gravelly sandy clay loam
2Btb—57 to 60 inches; silty clay loam

Dissimilar Minor Components

Percentage of map unit: 10 percent
Landform: Depressions, drainageways, flood plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Concave
Across-slope shape: Linear, concave

Endoaquolls
Percentage of map unit: 5 percent
Landform: Drainageways, stream terraces, flood plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Linear

9124—Caldwell-Cald complex, 0 to 3 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,300 to 2,650 feet
Mean annual precipitation: 18 to 23 inches
Mean annual air temperature: 47 to 49 degrees F
Frost-free period: 100 to 135 days

Map Unit Composition

Caldwell and similar soils: 60 percent
Cald and similar soils: 25 percent
Dissimilar minor components: 15 percent

Characteristics of Caldwell

Setting
Landform: Loess hills, drainageways
Geomorphic position (two-dimensional): Toeslopes
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from loess
Slope range: 0 to 3 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Somewhat poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Occasional (see Water Features table)
Ponding frequency: None
Seasonal high water table (minimum depth): About 16 to 21 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 12 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4w
Land capability subclass (irrigated): 4w
Ecological site: LOAMY BOTTOM 16-24 PZ (R009XY402WA)

Typical profile
Ap1—0 to 4 inches; silt loam
Ap2—4 to 10 inches; silt loam
A1—10 to 16 inches; silt loam
A2—16 to 21 inches; silt loam
AB—21 to 30 inches; silt loam
Bw—30 to 40 inches; silt loam
Bt1—40 to 52 inches; silt loam
Bt2—52 to 60 inches; silt loam

Characteristics of Cald

Setting
Landform: Flood plains
Geomorphic position (three-dimensional): Treads
Downslope shape: Linear
Across-slope shape: Concave
Aspect (range): All aspects

Properties and qualities
Parent material: Alluvium derived from loess
Slope range: 0 to 2 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Poorly drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: Frequent (see Water Features table)

Ponding frequency: None
Seasonal high water table (minimum depth): About 11 to 13 inches (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 11.5 inches)

Interpretive groups
Land capability subclass (nonirrigated): 5w
Land capability subclass (irrigated): 5w
Ecological site: WET MEADOW 16-24 PZ (R009XY601WA)

Typical profile
Ap1—0 to 7 inches; silt loam
Ap2—7 to 13 inches; silt loam
Ab—13 to 17 inches; silt loam
Ab/Bgb—17 to 25 inches; stratified silt loam to very fine sandy loam
Bgb1—25 to 40 inches; silt loam
Bgb2—40 to 48 inches; silt loam
Btgb—48 to 60 inches; silty clay loam

9300—Taney ashy silt loam, 3 to 8 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,560 to 3,220 feet
Mean annual precipitation: 25 to 28 inches
Mean annual air temperature: 43 to 45 degrees F
Frost-free period: 90 to 110 days

Map Unit Composition

Taney and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Taney

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Concave
Across-slope shape: Linear
Aspect (range): All aspects

Properties and qualities
Parent material: Volcanic ash over loess
Slope range: 3 to 8 percent
Depth to restrictive feature: 23 to 40 inches to a fragipan
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 16 to 22 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 7.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Land capability subclass (irrigated): 4e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; ashy silt loam
BA—4 to 15 inches; ashy silt loam
Bw—15 to 22 inches; silt loam
Bt—22 to 29 inches; silt loam

9340—Arson-Lotuspoint complex, 10 to 40 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,250 to 3,600 feet
Mean annual precipitation: 30 to 33 inches
Mean annual air temperature: 42 to 49 degrees F
Frost-free period: 90 to 130 days

Map Unit Composition

Arson and similar soils: 45 percent
Lotuspoint and similar soils: 35 percent
Dissimilar minor components: 20 percent

Characteristics of Arson

Setting
Landform: Mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): Southwest
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Volcanic ash and loess over colluvium and residuum derived from siltite and fine-grained quartzite
Slope range: 10 to 40 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 8.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; ashy silt loam
BA—5 to 9 inches; ashy silt loam
EBt—9 to 15 inches; silt loam
Bt1—15 to 38 inches; silt loam
2Bt2—38 to 43 inches; very gravelly silt loam
2BCt—43 to 57 inches; very gravelly silt loam
2Crt—57 to 67 inches; bedrock

Characteristics of Lotuspoint

Setting
Landform: Mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Thin mantle of volcanic ash over colluvium and residuum derived from siltite and fine-grained quartzite
Slope range: 10 to 40 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e

A—2 to 5 inches; ashy silt loam
BA—5 to 9 inches; ashy silt loam
EBt—9 to 15 inches; silt loam

Bt1—15 to 38 inches; silt loam
2Bt2—38 to 43 inches; very gravelly silt loam
2BCt—43 to 57 inches; very gravelly silt loam
2Crt—57 to 67 inches; bedrock

Dissimilar Minor Components

Benewah soils
Percentage of map unit: 5 percent
Landform: Hills, mountains
Geomorphic position (two-dimensional): Summits, shoulders
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Concave

Sharptop soils
Percentage of map unit: 5 percent
Landform: Hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Convex

Bechtel soils
Percentage of map unit: 3 percent
Landform: Hills, mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Lower third of mountain flanks
Downslope shape: Linear
Across-slope shape: Convex, concave

Grangemont soils, warm
Percentage of map unit: 2 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Shoulders
Geomorphic position (three-dimensional): Interfluves
Downslope shape: Linear
Across-slope shape: Concave

9342—Sinkler, dry-Arson, dry complex, 10 to 40 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,750 to 3,350 feet
Mean annual precipitation: 27 to 33 inches
Mean annual air temperature: 42 to 46 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Sinkler, dry, and similar soils: 45 percent
Arson, dry, and similar soils: 40 percent
Dissimilar minor components: 15 percent

Characteristics of Sinkler, Dry

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Lower third of mountain flanks, side slopes
Downslope shape: Linear
Across-slope shape: Concave
Aspect (representative): Southwest
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Loess over older loess with an influence of volcanic ash in the upper part
Slope range: 10 to 30 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): High (about 9.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 8 inches; ashy silt loam
Bt—8 to 14 inches; silt loam
BtE—14 to 20 inches; silt loam
Btb1—20 to 33 inches; silty clay loam
Btb2—33 to 44 inches; silty clay loam
Btxbc—44 to 62 inches; silt loam

Characteristics of Arson, Dry

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Lower third of mountain flanks, side slopes
Downslope shape: Linear
Across-slope shape: Convex
Aspect (representative): Southwest
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Volcanic ash and loess over colluvium and residuum derived from siltite and fine-grained quartzite
Slope range: 10 to 40 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high

Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 8.4 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; ashy silt loam
BA—5 to 9 inches; ashy silt loam
EBt—9 to 15 inches; silt loam
Bt1—15 to 38 inches; silt loam
2Bt2—38 to 43 inches; very gravelly silt loam
2BCt—43 to 57 inches; very gravelly silt loam
2Crt—57 to 67 inches; bedrock

Dissimilar Minor Components

Ardenvoir soils, dry
Percentage of map unit: 8 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Convex
Across-slope shape: Convex

McCrosket soils
Percentage of map unit: 3 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Linear
Across-slope shape: Concave

Lotuspoint soils
Percentage of map unit: 2 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex

Sinkler soils
Percentage of map unit: 2 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Footslopes
Geomorphic position (three-dimensional): Lower third of mountain flanks, side slopes
Downslope shape: Linear
Across-slope shape: Concave

9350—Southwick ashy silt loam, 3 to 8 percent slopes

Map Unit Setting

General landscape: Columbia basalt plateaus
Major land resource area (MLRA): 9—Palouse and Nez Perce Prairies
Elevation: 2,530 to 3,020 feet
Mean annual precipitation: 20 to 28 inches
Mean annual air temperature: 47 to 50 degrees F
Frost-free period: 100 to 130 days

Map Unit Composition

Southwick and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Southwick

Setting
Landform: Loess hills
Geomorphic position (two-dimensional): Summits, footslopes
Geomorphic position (three-dimensional): Interfluves, side slopes
Downslope shape: Convex
Across-slope shape: Linear
Aspect (representative): North
Aspect (range): All aspects

Properties and qualities
Parent material: Loess with an influence of volcanic ash in the upper part over older loess
Slope range: 3 to 8 percent
Depth to restrictive feature: None within a depth of 60 inches
Drainage class: Moderately well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): About 24 to 32 inches, perched (see Water Features table)
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very high (about 12.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3w
Land capability subclass (irrigated): 3e
Forest Service habitat type: Ponderosa pine/ninebark (CN190)

Typical profile
Ap—0 to 6 inches; ashy silt loam
A—6 to 13 inches; silt loam
Bw—13 to 28 inches; silt loam
E—28 to 31 inches; silt loam
Btcxb—31 to 49 inches; silty clay loam
Btcb1—49 to 54 inches; silty clay loam
Btcb2—54 to 70 inches; silt loam

Dissimilar Minor Components

Larkin soils

9610—Schumacher silt loam, 5 to 25 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,550 to 3,300 feet
Mean annual precipitation: 20 to 24 inches
Mean annual air temperature: 45 to 48 degrees F
Frost-free period: 120 to 135 days

Map Unit Composition

Schumacher and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Schumacher

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes, footslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Linear
Across-slope shape: Convex, concave
Aspect (representative): West
Aspect (range): South to northwest (clockwise)

Properties and qualities
Parent material: Loess mixed with colluvium and residuum derived from metasedimentary rock
Slope range: 5 to 25 percent
Depth to restrictive feature: 40 to 60 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 7.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 3e
Ecological site: LOAMY 16-22 FEID-PSSPS (R009XY003ID)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 8 inches; silt loam
BA—8 to 20 inches; silt loam
Bt1—20 to 27 inches; silt loam
Bt2—27 to 34 inches; gravelly silt loam
Bt3—34 to 41 inches; very cobbly clay loam
Bt4—41 to 47 inches; gravelly clay loam
R—47 to 57 inches; bedrock

Dissimilar Minor Components

Tekoa soils
Percentage of map unit: 8 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex

Libertybutte soils
Percentage of map unit: 5 percent
Landform: Hills, mountains
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex

McCrosket soils
Percentage of map unit: 5 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Linear
Across-slope shape: Concave

Larkin soils
Percentage of map unit: 2 percent
Landform: Loess hills
Geomorphic position (two-dimensional): Shoulders, summits

Geomorphic position (three-dimensional): Interfluves, side slopes
Downslope shape: Convex
Across-slope shape: Convex

9611—Schumacher-Tekoa complex, 25 to 40 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,600 to 3,500 feet
Mean annual precipitation: 20 to 28 inches
Mean annual air temperature: 47 to 49 degrees F
Frost-free period: 100 to 140 days

Map Unit Composition

Schumacher and similar soils: 45 percent
Tekoa and similar soils: 40 percent
Dissimilar minor components: 15 percent

Characteristics of Schumacher

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Convex, linear
Across-slope shape: Convex, concave
Aspect (representative): West
Aspect (range): South to northwest (clockwise)

Properties and qualities
Parent material: Loess mixed with colluvium and residuum derived from metasedimentary rock
Slope range: 25 to 40 percent
Depth to restrictive feature: 40 to 60 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 7.8 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Ecological site: LOAMY 16-22 FEID-PSSPS (R009XY003ID)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 8 inches; silt loam
BA—8 to 20 inches; silt loam
Bt1—20 to 27 inches; silt loam
Bt2—27 to 34 inches; gravelly silt loam
Bt3—34 to 41 inches; very cobbly clay loam

Bt4—41 to 47 inches; gravelly clay loam
R—47 to 57 inches; bedrock

Characteristics of Tekoa

Setting
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes, shoulders
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): West
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Volcanic ash and loess over colluvium and residuum over metasedimentary rock
Slope range: 25 to 40 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Ecological site: SOUTH SLOPE LOAMY 16-22 PSSPS-FEID (R009XY004ID)

Typical profile
A1—0 to 7 inches; gravelly ashy silt loam
A2—7 to 13 inches; very cobbly silt loam
BA—13 to 17 inches; very cobbly silt loam
Bt1—17 to 27 inches; very cobbly silty clay loam
Bt2—27 to 33 inches; very gravelly silty clay loam
R—33 to 43 inches; bedrock

Dissimilar Minor Components

Libertybutte soils
Percentage of map unit: 5 percent
Landform: Hills, mountains
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex

McCrosket soils
Percentage of map unit: 5 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Linear
Across-slope shape: Concave

Cassyhill soils
Percentage of map unit: 3 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex

Arson soils, dry
Percentage of map unit: 2 percent
Landform: Mountains, hills
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Lower third of mountain flanks, side slopes
Downslope shape: Linear
Across-slope shape: Convex

9612—Libertybutte-Tekoa complex, 5 to 30 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains and foothills
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,850 to 3,700 feet
Mean annual precipitation: 20 to 25 inches
Mean annual air temperature: 47 to 50 degrees F
Frost-free period: 100 to 140 days

Map Unit Composition

Libertybutte and similar soils: 45 percent
Tekoa and similar soils: 40 percent
Dissimilar minor components: 15 percent

Characteristics of Libertybutte

Setting
Landform: Hills, mountains
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): Southwest
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Loess over colluvium and residuum derived from argillite, siltite, and fine-grained quartzite
Slope range: 5 to 30 percent
Depth to restrictive feature: 12 to 19 inches to paralithic bedrock, 12 to 20 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None

Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Very low (about 2.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Ecological site: SHALLOW SOUTH SLOPE STONY 16-22 PSSPS-POSE (R009XY026ID)

Typical profile
A—0 to 4 inches; gravelly silt loam
Bt1—4 to 11 inches; gravelly silt loam
Bt2—11 to 16 inches; very gravelly silt loam
Crt—16 to 19 inches; bedrock
R—19 to 29 inches; bedrock

Characteristics of Tekoa

Setting
Landform: Hills, mountains
Geomorphic position (two-dimensional): Summits, shoulders, backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): West
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Volcanic ash and loess over colluvium and residuum derived from metasedimentary rock
Slope range: 10 to 30 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3.7 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Ecological site: SOUTH SLOPE LOAMY 16-22 PSSPS-FEID (R009XY004ID)

Typical profile
A1—0 to 7 inches; gravelly ashy silt loam
A2—7 to 13 inches; very cobbly silt loam
BA—13 to 17 inches; very cobbly silt loam
Bt1—17 to 27 inches; very cobbly silty clay loam
Bt2—27 to 33 inches; very gravelly silty clay loam
R—33 to 43 inches; bedrock

Dissimilar Minor Components

Schumacher soils
Percentage of map unit: 10 percent
Landform: Mountains, hills

Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Side slopes
Downslope shape: Convex, linear

9613—Ardenvoir, dry-Lotuspoint complex, 5 to 30 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,250 to 3,850 feet
Mean annual precipitation: 28 to 35 inches
Mean annual air temperature: 42 to 49 degrees F
Frost-free period: 90 to 140 days

Map Unit Composition

Ardenvoir, dry, and similar soils: 50 percent
Lotuspoint and similar soils: 35 percent
Dissimilar minor components: 15 percent

Characteristics of Ardenvoir, Dry

Setting
Landform: Mountains
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to west (clockwise)

Properties and qualities
Parent material: Volcanic ash and loess over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 5 to 30 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None

Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 3 inches; gravelly ashy silt loam
AB—3 to 11 inches; gravelly ashy silt loam
Bw—11 to 18 inches; very gravelly loam
C1—18 to 32 inches; extremely gravelly loam
C2—32 to 41 inches; extremely cobbly loam
C3—41 to 60 inches; extremely stony loam
Cr—60 to 70 inches; bedrock

Characteristics of Lotuspoint

Setting
Landform: Mountains
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Upper third of mountain flanks
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): South to west (clockwise)

Properties and qualities
Parent material: Thin mantle of volcanic ash over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 5 to 30 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 3 inches)

Interpretive groups
Land capability subclass (nonirrigated): 4e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly ashy silt loam
AB—4 to 10 inches; stony ashy silt loam
2Bw1—10 to 16 inches; extremely stony silt loam
2Bw2—16 to 26 inches; extremely stony loam
2R—26 to 36 inches; bedrock

Dissimilar Minor Components

Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.6 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Grand fir/ninebark (CN506)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; gravelly ashy silt loam
Bw1—6 to 11 inches; gravelly ashy silt loam
Bw2—11 to 19 inches; gravelly loam

C1—19 to 39 inches; very cobbly loam
C2—39 to 48 inches; extremely cobbly loam
Cr—48 to 60 inches; bedrock

9704—Ardenvoir, dry-Ardenvoir complex, 15 to 35 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,780 to 3,990 feet
Mean annual precipitation: 28 to 35 inches
Mean annual air temperature: 42 to 46 degrees F
Frost-free period: 90 to 120 days

Map Unit Composition

Ardenvoir, dry, and similar soils: 45 percent
Ardenvoir and similar soils: 40 percent
Dissimilar minor components: 15 percent

Characteristics of Ardenvoir, Dry

Setting
Landform: Mountains
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Convex
Across-slope shape: Convex
Aspect (representative): South
Aspect (range): Southeast to southwest (clockwise)

Properties and qualities
Parent material: Volcanic ash and loess over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 15 to 35 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Low (about 5.9 inches)

Interpretive groups
Land capability subclass (nonirrigated): 6e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 3 inches; gravelly ashy silt loam
AB—3 to 11 inches; gravelly ashy silt loam
Bw—11 to 18 inches; very gravelly loam
C1—18 to 32 inches; extremely gravelly loam
C2—32 to 41 inches; extremely cobbly loam
C3—41 to 60 inches; extremely stony loam
Cr—60 to 70 inches; bedrock

Characteristics of Ardenvoir

Setting
Landform: Mountains
Geomorphic position (two-dimensional): Shoulders, backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Linear
Across-slope shape: Concave
Aspect (representative): Southeast
Aspect (range): East to west (clockwise)

Properties and qualities
Parent material: Volcanic ash and loess over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 15 to 35 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock

Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None

Landform: Mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Lower third of mountain flanks
Downslope shape: Linear
Across-slope shape: Concave

Rock outcrop
Percentage of map unit: 2 percent

9770—Pinecreek gravelly ashy silt loam, 30 to 75 percent slopes

Map Unit Setting

General landscape: Northern Rocky Mountains
Major land resource area (MLRA): 43A—Northern Rocky Mountains
Elevation: 2,210 to 4,450 feet
Mean annual precipitation: 25 to 51 inches
Mean annual air temperature: 45 to 46 degrees F
Frost-free period: 95 to 125 days

Map Unit Composition

Pinecreek and similar soils: 80 percent
Dissimilar minor components: 20 percent

Characteristics of Pinecreek

Setting
Landform: Mountains
Geomorphic position (two-dimensional): Backslopes
Geomorphic position (three-dimensional): Mountain flanks
Downslope shape: Linear
Across-slope shape: Concave
Aspect (representative): South
Aspect (range): Northeast to west (clockwise)

Properties and qualities
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 30 to 75 percent
Depth to restrictive feature: None to a depth of 60 inches
Drainage class: Well drained
Capacity of the most limiting soil layer to transmit water (Ksat): Moderately high
Flooding frequency: None
Ponding frequency: None
Seasonal high water table (minimum depth): More than 72 inches
Salinity (maximum): Not saline
Sodicity (maximum): Not sodic
Available water capacity (entire profile): Moderate (about 6.2 inches)

Interpretive groups
Land capability subclass (nonirrigated): 7e
Forest Service habitat type: Douglas-fir/ninebark (CN260)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A1—2 to 6 inches; gravelly ashy silt loam
A2—6 to 12 inches; gravelly ashy silt loam
Bw1—12 to 19 inches; gravelly ashy silt loam
Bw2—19 to 24 inches; gravelly ashy silt loam
2Bw3—24 to 30 inches; very gravelly loam
2C—30 to 70 inches; extremely cobbly loam

Use and Management of the Soils

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as rangeland and forestland; as sites for buildings, sanitary facilities, highways and other transportation systems, and parks and other recreational facilities; for agricultural waste management; and as wildlife habitat. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Land managers and others using soil survey information can evaluate the effect of specific land uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of gravel, sand, reclamation material, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes and locate sites for pavements, sidewalks, campgrounds, playgrounds, lawns, and trees and shrubs.

Interpretive Ratings

The interpretive tables in this survey rate the soils in the survey area for various uses. Many of the tables identify the limitations that affect specified uses and indicate the severity of those limitations. The ratings in these tables are both verbal and numerical.

Rating Class Terms

Rating classes are expressed in the tables in terms that indicate the extent to which the soils are limited by all of the soil features that affect a specified use or in terms that indicate the suitability of the soils for the use. Thus, the tables may show limitation classes or suitability classes. Terms for the limitation classes are *not limited, somewhat limited,* and *very limited*. The suitability ratings are expressed as *well suited, moderately suited, poorly suited,* and *unsuited* or as *good, fair,* and *poor*.

Numerical Ratings

Numerical ratings in the tables indicate the relative severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.00 to 1.00. They indicate

gradations between the point at which a soil feature has the greatest negative impact on the use and the point at which the soil feature is not a limitation. The limitations appear in order from the most limiting to the least limiting. Thus, if more than one limitation is identified, the most severe limitation is listed first and the least severe one is listed last.

Soil Survey Information on the Internet

Additional information about the soils and the detailed soil maps for the survey area are available online from the Web Soil Survey site (http://websoilsurvey.nrcs.usda.gov/app/). The information on this site is the official soil survey data.

Crops and Pasture

By Joel Poore, conservation agronomist, Natural Resources Conservation Service.

General considerations for the use and management of the soils in the survey area as cropland and pastureland are included in this section. The section discusses common systems used for crop production; the influence of climate, landform, and soils on the crops grown; and the impact of crop production systems on the soils. It also identifies the common crops and forage plants, explains the system of land capability classification used by the Natural Resources Conservation Service, and discusses crop productivity and yield expectations. Planners of management systems for individual fields and farms should consider the detailed information given under the headings “Detailed Soil Map Units,” “Use and Management of the Soils,” and “Soil Properties.” Specific information can be obtained from the local office of the Natural Resources Conservation Service or the Cooperative Extension Service or from the Spokane County Conservation District office.

The soils and climate patterns in the survey area provide favorable growing conditions for most cool-season grasses and broadleaf crops. The productivity of an individual soil primarily depends on whether or not the depth of the soil allows for sufficient root growth and soil moisture storage to support growth during the hot, dry period in summer. Warm-season grasses and broadleaf crops, such as short-season corn, trees and vines, and specialty vegetables, can be grown with supplemental irrigation in summer.

The growing conditions in the survey area include a cool, wet period in spring. Soil temperatures increase slowly in spring, which affects biological activity in the soil and the growth rate of crops. Soils that are frozen and covered with snow early in spring may be subject to erosion from runoff during periods of rainfall or snowmelt.

The soils warm up quickly during May and June in most years, providing optimum conditions for rapid plant growth. July through September generally are very dry, with little chance of convective storms. The extensive root systems developed in spring and the stored soil moisture enable crops to complete their growth cycle in summer.

Maturing and harvesting of small grain occurs in mid-July to late in August in most years. Winter small grain is planted late in August to early in October. Cool-season pasture grasses commonly continue to grow slowly through November.

Cool-season annual crops, such as wheat, and perennial crops, such as alfalfa, resume or begin growth in spring when the soil temperature is cool and variable. Snow cover commonly persists on the soils through March. Root development early in spring is important for successful crop production and survival during the dry period in summer.

About 298,000 acres of the survey area is considered harvested cropland. Of this, about 3,000 to 5,000 acres is irrigated and the rest is nonirrigated. The dominant harvested crop is small grain, including winter wheat (98,638 acres) and spring wheat (42,108 acres). Barley, oats, and triticale are grown on about 30,000 acres each year.

Cool-season broadleaf crops, such as dry edible peas and lentils (7,000 acres), and oilseed crops, such as canola and mustard (1,500 acres), are grown in rotation with the small grain. The trend is toward increased production of oilseed crops as the demand for biofuel feedstock increases.

Alfalfa (36,400 acres), most of which is nonirrigated, is grown for hay, green chop, and silage. Records from 2007 indicate that only about 10 percent was irrigated. Other forage crops include small grain and mixed perennial grasses for hay (24,600 acres). Grass seed (24,200 acres) is grown in the eastern part of the survey area that receives more rainfall. Most of it is nonirrigated. Orchard crops, vineyard crops, nursery crops, and specialty vegetables are produced on about 2,000 acres. About 80 percent of these crops are irrigated and grown on farms that are 0 to 15 acres in size.

About 36 percent of the survey area, or 395,000 acres, is considered unharvested cropland. This includes land used for conservation, pastureland, forestland, and land under fallow. Cropping systems that include a fallow period are becoming less common in most of the survey area. Only 24,000 acres were recorded as fallowed in 2007, primarily in the western and southern parts of the survey area that receive less precipitation. Conservation practices, such as use of grassed waterways, riparian buffers, and buffer strips, help to minimize surface runoff and soil erosion and improve soil quality.

Crop productivity is influenced by the chemical properties, water features, and physical properties of the soils, climate, and landscape. These properties can be used to determine a productivity index to aid in establishing realistic yield goals. The productivity of a soil can be enhanced with the use of management practices such as applying fertilizer and soil amendments, managing pests, selecting the best varieties of crops, irrigating, and tilling.

Chemical soil properties in the root zone that impact productivity include soil pH, cation-exchange capacity (CEC), organic matter in the surface layer and subsoil, and electrical conductivity (EC) and sodium adsorption ratio (SAR) in the surface layer and subsoil, which can indicate salt concentrations that inhibit seed germination and availability of water. Physical soil properties that affect productivity include saturated hydraulic conductivity (Ksat), bulk density, content of rock fragments, and depth to a restrictive layer. Climatic properties include frost-free days and mean annual precipitation, both of which vary considerably across the survey area.

Available water capacity within the root zone is influenced by soil depth, structure, texture, and organic matter. The steepness and shape of slope affect water movement. Some of the well-developed silt loam soils in the survey area have a dense clay layer that restricts water movement through the profile.

Deep silt loam soils that are well developed and have slope of 0 to 30 percent or more are primarily in the eastern part of the survey area. Shallower silt loam soils underlain by basalt are in the western part of the survey area that receives less precipitation. Very shallow soils and soils that have a restrictive layer commonly are used as native rangeland.

Some soils have variable textures and a high content of coarse fragments. These soils are on flood plains, in areas at the lower elevations, and on outwash terraces. Some areas have a water table at a shallow depth or are subject to seasonal ponding that can affect crop growth. The water table can provide subirrigation for hay and pasture crops that can be beneficial if the surface is not saturated for long periods of time.

Winter wheat is the major nonirrigated crop. A grain-fallow system can be used in the drier western areas of the survey area (12- to 16-inch rainfall zone) to conserve soil moisture. This can improve germination and emergence of winter grain seeded in fall. Residue management and tillage can be used to control weeds and conserve moisture. Tillage systems used range from conventional tillage to no-till.

Early emergence of crops seeded in fall allows for root development prior to winter, which is essential for survival and yield potential the following year. Residue and tillage management systems help to minimize soil disturbance in areas that receive adequate moisture for growing crops annually without a fallow period. Crop residue kept on the surface in winter helps to retain moisture from snow and rain and minimize the risk of wind and water erosion. A straight chisel in fall can be used to improve water infiltration on steep slopes. Excessive tillage decreases water infiltration and increases the risk of runoff and erosion. Water erosion, which is a main concern on the soils in the survey area, can be minimized by the use of proper residue management and tillage, contour stripcropping, chisel plowing perpendicular to the slope, grassed waterways, and diversions at proper intervals on the slope.

Potential yields for small grain in the survey area can be estimated according to annual precipitation zones, including areas that receive more than 20 inches, 16 to 20 inches, and 12 to 16 inches. Most of the rainfall in the survey area is received in October through May. Washington State University Extension has conducted research on several varieties of small grain in the survey area.

The average yields per acre that can be expected under a high level of management are shown in the following table. In any given year, yields may be higher or lower than those indicated in the table because of variations in rainfall and other climatic factors. Constantly improving technology that includes variety development, nutrient and pest management techniques, irrigation water management, and residue and tillage management helps to increase the potential yields. Other yield data is available from local farmers, Spokane County Conservation District, Washington State University Extension, and local offices of the Natural Resources Conservation Service.

Summary of 5-Year Yields for Small Grain

(Washington State University [http://variety.wsu.edu/])

Small grain class	Precipitation (inches)	Maximum yield	Average yield
Soft white winter wheat (bu/acre)	>20	136	122
	16-20	105	95
	12-20	100	89
Hard red winter wheat (bu/acre)	>20	133	118
	16-20	101	86
	12-16	89	77
Hard spring wheat (bu/acre)	>20	74	71
	16-20	50	47
	12-16	50	47
Soft white spring wheat (bu/acre)	>20	84	80
	16-20	62	57
	12-16	58	50
Spring barley (lbs/acre)	>20	6,280	5,150
	16-20	4,020	3,410
	12-20	3,890	3,180

The management needed to obtain the indicated yields of the various crops depends on the kind of soil and the crop. Management can include crop rotations; drainage, erosion control, and protection from flooding; proper planting and seeding techniques and rates; suitable high-yielding crop varieties; appropriate and timely tillage; control of weeds, plant diseases, and harmful insects; favorable soil pH and optimum levels of nitrogen, phosphorus, potassium, and trace elements for each crop; effective use of crop residue, barnyard manure, and green-manure crops; and harvesting that ensures the smallest possible loss.

Crop Productivity Indices

Crop productivity indices provide an estimate of the relative productivity of soil map unit components for the principal crops grown in the survey area. The indices are numerical values that range from 0.00 to 1.00. The greater the value, the higher the potential productivity for the crop.

Crop productivity indices rather than actual estimated yields are provided because of the difficulty of collecting accurate, reliable crop yield data. Also, development of new crop varieties and advancements in crop production technology can result in estimated yields becoming obsolete over time.

The criteria for the crop productivity indices were developed by soil scientists and agronomists familiar with the soils and crops in the survey area and the cropland management practices used. The National Commodity Crop Productivity Index (NCCPI) was modified for local soil and climatic conditions. More information on the NCCPI is available at www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/nrcs142p2_050734.pdf.

The criteria for the crop productivity indices can be grouped into five categories—physical soil properties, chemical soil properties, climate, landscape, and soil water. Physical soil properties include rock fragment content, depth to root-restricting layers, and clay content. Chemical soil properties include organic matter content, sodium adsorption ratio, electrical conductivity, pH, calcium carbonate content, and cation-exchange capacity. Climate properties include the number of frost-free days and mean annual precipitation. Landscape criteria include steepness of slope, stones and boulders on the soil surface, depth to and duration of the water table during the growing season, frequency and duration of flooding during the growing season, and frequency and duration of ponding during the growing season. The soil water criterion is based on the available water capacity.

Table 6 gives productivity indices for nonirrigated wheat. Table 7 gives productivity indices for nonirrigated alfalfa hay, nonirrigated grass hay, and subirrigated wild hay. The term “subirrigated” refers to a condition where water is supplied to the crop from a naturally occurring water table.

Land Capability Classification

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for rangeland, for forestland, or for engineering purposes.

In the capability system, soils are generally grouped at three levels—capability class, subclass, and unit (USDA, 1961). Only class and subclass are used in this survey.

Capability classes, the broadest groups, are designated by the numbers 1 through 8. The numbers indicate progressively greater limitations and narrower choices for practical use. The classes are defined as follows:

Class 1 soils have slight limitations that restrict their use.

Class 2 soils have moderate limitations that restrict the choice of plants or that require moderate conservation practices.

Class 3 soils have severe limitations that restrict the choice of plants or that require special conservation practices, or both.

Class 4 soils have very severe limitations that restrict the choice of plants or that require very careful management, or both.

Class 5 soils are subject to little or no erosion but have other limitations, impractical to remove, that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 6 soils have severe limitations that make them generally unsuitable for cultivation and that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 7 soils have very severe limitations that make them unsuitable for cultivation and that restrict their use mainly to grazing, forestland, or wildlife habitat.

Class 8 soils and miscellaneous areas have limitations that preclude commercial plant production and that restrict their use to recreational purposes, wildlife habitat, watershed, or esthetic purposes.

Capability subclasses are soil groups within one class. They are designated by adding a small letter, *e, w, s,* or *c,* to the class numeral, for example, 2e. The letter *e* shows that the main hazard is the risk of erosion unless close-growing plant cover is maintained; *w* shows that water in or on the soil interferes with plant growth or cultivation (in some soils the wetness can be partly corrected by artificial drainage); *s* shows that the soil is limited mainly because it is shallow, droughty, or stony; and *c,* used in only some parts of the United States, shows that the chief limitation is climate that is very cold or very dry.

In class 1 there are no subclasses because the soils of this class have few limitations. Class 5 contains only the subclasses indicated by *w, s,* or *c* because the soils in class 5 are subject to little or no erosion. They have other limitations that restrict their use to pasture, rangeland, forestland, wildlife habitat, or recreation.

The capability classification of the soils in this survey area is given in the section “Detailed Soil Map Units” and in table 6.

Prime Farmland and Other Important Farmland

Table 8 lists the map units in the survey area that are considered prime farmland and farmland of statewide importance. This list does not constitute a recommendation for a particular land use.

In an effort to identify the extent and location of important farmland, the Natural Resources Conservation Service, in cooperation with other interested Federal, State, and local government organizations, has inventoried land that can be used for the production of the Nation’s food supply.

Prime farmland is of major importance in meeting the Nation’s short- and long-range needs for food and fiber. Because the supply of high-quality farmland is limited, the U.S. Department of Agriculture recognizes that responsible levels of government, as well as individuals, should encourage and facilitate the wise use of our Nation’s prime farmland.

Prime farmland, as defined by the U.S. Department of Agriculture, is land that has the best combination of physical and chemical characteristics for producing food, feed,

forage, fiber, and oilseed crops and is available for these uses. It could be cultivated land, pastureland, forestland, or other land, but it is not urban or built-up land or water areas. The soil quality, growing season, and moisture supply are those needed for the soil to economically produce sustained high yields of crops when proper management, including water management, and acceptable farming methods are applied. In general, prime farmland has an adequate and dependable supply of moisture from precipitation or irrigation, a favorable temperature and growing season, acceptable acidity or alkalinity, an acceptable salt and sodium content, and few or no rocks. The water supply is dependable and of adequate quality. Prime farmland is permeable to water and air. It is not excessively erodible or saturated with water for long periods, and it either is not frequently flooded during the growing season or is protected from flooding. Slope ranges mainly from 0 to 6 percent. More detailed information about the criteria for prime farmland is available at the local office of the Natural Resources Conservation Service.

A recent trend in land use in some areas has been the loss of some prime farmland to industrial and urban uses. The loss of prime farmland to other uses puts pressure on marginal lands, which generally are more erodible, droughty, and less productive and cannot be easily cultivated.

For some soils identified in the table as prime farmland, measures that overcome a hazard or limitation, such as flooding, wetness, and droughtiness, are needed. Onsite evaluation is needed to determine whether or not the hazard or limitation has been overcome by corrective measures.

About 333,680 acres, or 30 percent, of the total acreage of the survey area meet the requirements for prime farmland.

In some areas, land that does not meet the criteria for prime or unique farmland is considered to be *farmland of statewide importance* for the production of food, feed, fiber, forage, and oilseed crops. The criteria for defining and delineating farmland of statewide importance are determined by the appropriate State agencies. Generally, this land includes areas of soils that nearly meet the requirements for prime farmland and that economically produce high yields of crops when treated and managed according to acceptable farming methods. Some areas may produce as high a yield as prime farmland if conditions are favorable. Farmland of statewide importance may include tracts of land that have been designated for agriculture by State law.

About 354,270 acres, or 31 percent, of the total acreage of the survey area meet the requirements for farmland of statewide importance.

Rangeland

By John Kouns, area rangeland management specialist, Natural Resources Conservation Service.

Rangeland consists of areas where the indigenous vegetation is dominantly grasses, grasslike plants, forbs, and shrubs and is managed as a natural ecosystem. Rangeland includes grassland, sagebrush steppe, desert, arid land, and prairie. Although rangeland is commonly associated with livestock production, it has many other uses including mining of mineral resources, solar and wind farms, wildlife viewing, hiking, commercial and private hunting and fishing, camping, and horseback and all-terrain vehicle riding. Managing for multiple uses has become more common and has provided additional sources of income for private landowners.

Rangeland comprises about 26 percent of the survey area, or about 296,000 acres. It can be distinguished from other land by the natural flora and fauna it supports. The majority of the historic rangeland in the United States, as well as in the survey area, is now under cultivation. Deposition and decay of foliage and roots of these primarily herbaceous plant communities produce some of the most productive soils in the world.

The northern part of the survey area is in the Rocky Mountain Range and Forest Region, as designated by a U.S. Department of Agriculture publication “Land Resource

Regions and Major Land Resource Areas of the United States." The Rocky Mountain valleys support both conifer forests and grassland plant communities. The upland grassland community historically produced 800 to 1,000 pounds per acre, dominantly bluebunch wheatgrass, Idaho fescue, rose, snowberry, lupine, arrowleaf balsamroot, and penstemon. The wet meadows, which produce 5,000 to 7,000 pounds per acre, dominantly support rushes, sedges, water-tolerant grasses, and woody shrubs such as redosier dogwood, serviceberry, and prickly currant.

The Palouse Prairie, in the southern part of the survey area, is in the Northwestern Wheat and Range Region and supports grasses, shrubs, and trees. Common grass and shrub species include bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, needleandthread, redosier dogwood, serviceberry, prickly currant, and sagebrush. Forb and tree species include arrowleaf balsamroot, sunflower species, meadow death-camas, silky lupine, western hawkweed, cottonwood, willow, and ponderosa pine. Deer, elk, moose, ground squirrels, gophers, voles, badgers, hawks, hummingbirds, and sharp-tailed grouse are in this region.

Table 9 shows, for each soil that supports vegetation suitable for grazing, the ecological site or plant association; the total annual production of vegetation in favorable, normal, and unfavorable years; the characteristic vegetation; and the average percentage of each species. An explanation of the column headings in the table follows.

An *ecological site* or *plant association* is the product of all the environmental factors responsible for its development. It has characteristic soils that have developed over time throughout the soil development process; a characteristic hydrology, particularly infiltration and runoff, that has developed over time; and a characteristic plant community (kind and amount of vegetation). The hydrology of the site is influenced by development of the soil and plant community. The vegetation, soils, and hydrology are all interrelated. Each is influenced by the others and influences the development of the others. The plant community on an ecological site or plant association is typified by a group of species that differs from that of other ecological sites or plant associations in the kind and/or proportion of species or in total production. Descriptions of ecological sites and plant associations are provided in the Field Office Technical Guide, which is available in local offices of the Natural Resources Conservation Service.

Rangeland trend, similarity index, and health ratings are used to evaluate rangeland. These assessments provide managers with the information needed to plan and apply appropriate practices to address management concerns.

Rangeland trend indicates the direction of change on a range site. The plant community and associated components of the ecosystem, such as soil stability and water holding capacity, may be either moving toward or away from the historic climax plant community or some other desired plant community.

The similarity index compares the current plant community with that of the historic climax plant community. In general, the index is a measurement of the noxious and invasive species in the plant community as compared to the historic plant community. For example, a similarity index of 25 percent or less indicates a range site heavily impacted by invasive species and a similarity index of 50 percent or more indicates that the plant community is dominantly native species.

Rangeland health evaluates the stability of the soil and site, hydrologic function, and integrity of the biotic community. This evaluation requires a good understanding of ecological processes, vegetation, and soils. It is based on the current conditions as compared to historic conditions (Pellant and others, 2005).

Total dry-weight production is the amount of vegetation that can be expected to grow annually in a well managed area that is supporting the potential natural plant community. It includes all vegetation, whether or not it is palatable to grazing animals. It includes the current year's growth of leaves, twigs, and fruits of woody plants. It does not include the increase in stem diameter of trees and shrubs. It is expressed in

pounds per acre of air-dry vegetation for favorable, normal, and unfavorable years. In a favorable year, the amount and distribution of precipitation and the temperatures make growing conditions substantially better than average. In a normal year, growing conditions are about average. In an unfavorable year, growing conditions are well below average, generally because of low available soil moisture. Yields are adjusted to a common percent of air-dry moisture content.

Characteristic vegetation (the grasses, forbs, shrubs, and trees that make up most of the potential natural plant community on each soil) is listed by common name. Under *forest* or *range composition*, the expected percentage of the total annual production is given for each species making up the characteristic vegetation. The amount that can be used as forage depends on the kinds of grazing animals and on the grazing season.

Range management requires a knowledge of the kinds of soil and of the potential natural plant community. It also requires an evaluation of the present range similarity index and rangeland trend. Range similarity index is determined by comparing the present plant community with the potential natural plant community on a particular rangeland ecological site. The more closely the existing community resembles the potential community, the higher the range similarity index. Rangeland trend is defined as the direction of change in an existing plant community relative to the potential natural plant community. Further information about the range similarity index and rangeland trend is available in the “National Range and Pasture Handbook,” which is available in local offices of the Natural Resources Conservation Service or on the Internet.

The objective in range management is to control grazing so that the plants growing on a site are about the same in kind and amount as the potential natural plant community for that site. Such management generally results in the optimum production of vegetation, control of undesirable brush species, conservation of water, and control of erosion. Sometimes, however, an area with a range similarity index somewhat below the potential meets grazing needs, provides wildlife habitat, and protects soil and water resources.

Forestland Management and Productivity

By Misty Seaboldt, forester, and Chandra Neils, soil scientist, Natural Resources Conservation Service.

About 30 percent, or about 308,650 acres, of the survey area is forested. Of this, 85 percent is privately owned and the rest is publicly owned. About 10 percent is administered by the State, 2 percent by the county, and 3 percent by the Federal government.

A number of small sawmills and a paper mill are in the survey area. Logs are generally shipped outside the area or state to larger mills. Pulpwood and chips are hauled to surrounding counties and states for processing (Washington State University, 2009).

Intensive forest management is common; however, large-scale management is difficult because much of the forestland has been divided into one- to five-acre parcels. Conservation and educational programs have led to a better understanding of forest ecosystems and management. Turnbull Wildlife Refuge, which is administered by the U.S. Fish and Wildlife Service, has an intensive forest management program in the southwestern part of the survey area. Little, if any, timber harvesting is permitted in Mount Spokane and Riverside State Parks. Most of the remaining forestland in the area has been harvested at least once.

The most common and potentially damaging pests in the coniferous forests are mistletoe and bark beetles. Dwarf mistletoe is a parasitic plant that affects ponderosa pine, Douglas-fir, lodgepole pine, western larch, and hemlock. Some of the ponderosa pine in the southern part of the area has been heavily damaged. Dwarf mistletoe

results in a loss in growth and wood quality and death in severe cases. The most common treatment for dwarf mistletoe is silviculture practices, including removing heavily damaged trees from the stand, removing branches in lightly infected trees, and converting species where possible.

The most common bark beetles are the Douglas-fir beetle (*Dendroctonus pseudotsugae*), mountain pine beetle (*Dendroctonus ponderosae*), pine engraver beetle (*Ips spp.*), and western pine beetle (*Dendroctonus brevicomis*). The Douglas-fir beetle affects Douglas-fir and western larch. This beetle is a natural part of the ecosystem, so eradication is impossible. Treatment includes removing downed or dead trees before the beetle levels become epidemic. The mountain pine beetle affects a variety of coniferous trees, including ponderosa pine, lodgepole pine, and western white pine. This beetle prefers large, older pine trees. Outbreaks generally begin in weakened trees, but healthy trees can be affected if the levels increase. Treatment for the mountain pine beetle generally is not feasible, so prevention is preferred. The pine engraver beetle affects ponderosa pine, lodgepole pine, and western white pine. This beetle is attracted to fresh, downed slash. In spring and summer, fresh slash should be scattered throughout the stand to help prevent large outbreaks. The western pine beetle most commonly attacks ponderosa pine. Maintaining a healthy forest stand, including maintaining proper spacing between trees and removing trees that have been killed by bark beetles, helps to prevent outbreaks of this beetle.

Historically, ponderosa pine forests were subject to fire on a regular basis. The bark of these trees could withstand low-intensity ground fires, which acted to naturally thin the forests. Trees that had less dense bark were killed, and therefore competition was reduced. High-intensity crown fires were more likely to be stand replacing. These fires commonly killed all standing trees. This created openings for sun-tolerant ponderosa pine to become established.

The location and productivity of forested soils in the survey area is determined by many factors. Effective precipitation, aspect, and elevation influence the soils and forest habitat types. The parent material of the soils is also a factor. Much of the forestland in the area is on soils derived from granite, gneiss, and schist with an influence of volcanic ash and loess in the surface layer. Volcanic ash has the most influence on productivity. The eruption of Mount St. Helens on May 18, 1980, and historically, the eruption of Mount Mazama (present-day Crater Lake, Oregon) deposited much ash in the area.

The influence of ash ranges from a small amount mixed into the upper part of the soil profile to several feet, forming a thick mantle. Forest productivity is affected by the properties of ash, such as high water holding capacity, high phosphorus retention, and low bulk density.

The principal habitat types in the survey area are ponderosa pine/snowberry (PIPO/SYAL) and ponderosa pine/Idaho fescue (PIPO/FEID). The ponderosa pine/snowberry habitat type is warm and dry. Some Douglas-fir is in the understory, but the main overstory component is ponderosa pine. The site index for this type ranges from 60 to 100. The dominant understory species are common yarrow, arrowleaf balsamroot, common snowberry, Idaho fescue, and bluebunch wheatgrass. Cheatgrass is in areas that have been grazed.

The ponderosa pine/Idaho fescue habitat type is also dry, but it tends to be cooler and drier than the ponderosa pine/snowberry type. The site index ranges from 64 to 100. Douglas-fir may be a minor component. The understory vegetation is highly variable, but bulbous bluegrass, Idaho fescue, and Saskatoon serviceberry are common.

For more information on forest habitat types, refer to the publication “Forest Habitat Types of Northern Idaho: A Second Approximation” (Cooper and others, 1991).

The forested soils in the survey area are shallow to very deep and sandy or gravelly to loamy. Because of the differences in the soils, climate, and geology, the forests vary in composition and productivity. They range from sparse stands of pine in the tree/grass transition zone to dense stands of mixed conifers on upland outwash terraces, foothills, and mountains.

In the southwestern corner of the area, the elevation is about 1,700 feet and the mean annual precipitation is about 15 inches. Many of the soils support pure stands of ponderosa pine. Past geologic processes formed biscuits, channeled scablands, and outwash plains. The site index values range from poor on the shallow scablands to fair or good on some of the deeper soils.

As elevation increases to the north and east, deep sand and sandy loam soils on terraces and benches along the Spokane and Little Spokane Rivers are common. These soils support low-producing stands of ponderosa pine.

North and east of the benches are soils that range from the sandy, gravelly, and droughty Springdale series, which support poor stands of ponderosa pine, to the very deep, ashy, very fine sandy loam Eloika series, which support excellent stands of Douglas-fir, western larch, and grand fir. Many soils derived from glacial outwash and stream deposits are also in this area. The soils support a mixture of ponderosa pine, Douglas-fir, western larch, and lodgepole pine. The mean annual precipitation is 18 to 22 inches. Many of the soils have high water-holding capacity that can provide moisture during the droughty period in summer. Productivity is affected by soil depth, restrictive layers, and texture. Many of the soils have clay bands in the subsoil that increase the water holding capacity and thus the productivity of the soils.

Many of the forests in the southwestern part of the survey area are suitable for grazing. Bunchgrass is the principal forage plant in areas where the range is in good condition. Because of the coarse and medium texture of the soils, the risk of compaction is minimal if the range is properly managed. Most of the forested areas are grazed to a limited extent. The amount of usable forage varies with the age and density of the forest canopy and past harvesting practices.

Site index values are used to measure forest productivity. In general, the site index is estimated by determining the average total height and age of dominant and co-dominant trees in a specified number of years in a well-stocked, even-aged stand.

Site index data has been determined for each forested soil in the survey area. Generally, at least three sites per soil series and at least three trees for each species were selected. Once a site index is determined for the individual sites, a standard deviation (SD) is calculated. To meet the National Forestry Manual standards, the SD must be below ten. If the SD is higher than ten, the culmination of mean annual increment (CMAI) is not calculated. If two or fewer sites were selected for a particular soil, the CMAI and SD were not calculated because of insufficient data. CMAI and age are estimated from the site index values for these soils (Smith and others, 2008).

In table 10, the *potential productivity* of merchantable or *common trees* on a soil is expressed as a site index and as a volume number. The *site index* is the average height, in feet, that dominant and codominant trees of a given species attain in a specified number of years. The site index applies to fully stocked, even-aged, unmanaged stands. A *site index curve number* is also given for each tree species. These numbers are correlated to specific site index publications. Commonly grown trees are those that forest managers generally favor in intermediate or improvement cuttings. They are selected on the basis of growth rate, quality, value, and marketability. More detailed information regarding site index is available in the "National Forestry Manual," which is available in local offices of the Natural Resources Conservation Service or on the Internet.

The *volume of wood fiber*, a number, is the yield likely to be produced by the most important tree species. This number, expressed as cubic feet per acre per year and

calculated at the age of culmination of the mean annual increment (CMAI), indicates the amount of fiber produced in a fully stocked, even-aged, unmanaged stand.

Trees to manage are those that are preferred for planting, seeding, or natural regeneration and those that remain in the stand after thinning or partial harvest.

Hydric Soils

Table 11 lists the map unit components that are rated as hydric soils in the survey area. This list can help in planning land uses; however, onsite investigation is recommended to determine the hydric soils on a specific site (National Research Council, 1995; USDA, 2010).

The three essential characteristics of wetlands are hydrophytic vegetation, hydric soils, and wetland hydrology (Cowardin and others, 1979; U.S. Army Corps of Engineers, 1987; National Research Council, 1995; Tiner, 1985). Criteria for all of the characteristics must be met for areas to be identified as wetlands. Undrained hydric soils that have natural vegetation should support a dominant population of ecological wetland plant species. Hydric soils that have been converted to other uses should be capable of being restored to wetlands.

Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). These soils, under natural conditions, are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation.

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 2002). These criteria are used to identify map unit components that normally are associated with wetlands. The criteria used are selected estimated soil properties that are described in “Soil Taxonomy” (Soil Survey Staff, 1999) and “Keys to Soil Taxonomy” (Soil Survey Staff, 2010) and in the “Soil Survey Manual” (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period of time to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils are specified in “Field Indicators of Hydric Soils in the United States” (USDA, 2010).

Hydric soils are identified by examining and describing the soil to a depth of about 20 inches. This depth may be greater if determination of an appropriate indicator so requires. It is always recommended that soils be excavated and described to the depth necessary for an understanding of the redoximorphic processes. Then, using the completed soil descriptions, soil scientists can compare the soil features required by each indicator and specify which indicators have been matched with the conditions observed in the soil. The soil can be identified as a hydric soil if at least one of the approved indicators is present.

Map units that are dominantly made up of hydric soils may have small areas, or inclusions, of nonhydric soils in the higher positions on the landform, and map units dominantly made up of nonhydric soils may have inclusions of hydric soils in the lower positions on the landform.

The criteria for hydric soils are represented by numbers in the table. The numbers indicate which of the following criteria were used to rate the soil as hydric. In some instances, a soil may satisfy more than one criteria; thus, more than one number is given in the table. Definitions for the numbers are as follows:

1. All Histels except Folistels and Histosols except Folists; or
2. Map unit components in Aquic suborders, great groups, or subgroups, Albolls suborder, Historthels great group, Histoturbels great group, or Andic, Cumulic, Pachic, or Vitrandic subgroups that:
   a. Based on the range of characteristics for the soil series, will at least in part meet one or more Field Indicators of Hydric Soils in the United States, or
   b. Show evidence that the soil meets the definition of a hydric soil;
3. Map unit components that are frequently ponded for long duration or very long duration during the growing season that:
   a. Based on the range of characteristics for the soil series, will at least in part meet one or more Field Indicators of Hydric Soils in the United States, or
   b. Show evidence that the soil meets the definition of a hydric soil; or
4. Map unit components that are frequently flooded for long duration or very long duration during the growing season that:
   a. Based on the range of characteristics for the soil series, will at least in part meet one or more Field Indicators of Hydric Soils in the United States, or
   b. Show evidence that the soils meet the definition of a hydric soil.

Soil Properties

Data relating to soil properties are collected during the course of the soil survey.

Soil properties are determined by field examination of the soils and by laboratory index testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine particle-size distribution, plasticity, and compaction characteristics.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas. Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties are shown in tables. They include engineering properties, physical and chemical properties, and pertinent soil and water features.

Engineering Soil Properties

Table 12 gives the engineering classifications and the range of engineering properties for the layers of each soil in the survey area.

Depth to the upper and lower boundaries of each layer is indicated.

Texture is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. “Loam,” for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is 15 percent or more, an appropriate modifier is added, for example, “gravelly.” Textural terms are defined in the Glossary.

Classification of the soils is determined according to the Unified soil classification system (ASTM, 2005) and the system adopted by the American Association of State Highway and Transportation Officials (AASHTO, 2004).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to particle-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, CL-ML.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of particle-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

Rock fragments larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages

are estimates determined mainly by converting volume percentage in the field to weight percentage.

Percentage (of soil particles) passing designated sieves is the percentage of the soil fraction less than 3 inches in diameter based on an ovendry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

Liquid limit and *plasticity index* (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

Physical Soil Properties

Table 13 shows estimates of some physical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.

Particle size is the effective diameter of a soil particle as measured by sedimentation, sieving, or micrometric methods. Particle sizes are expressed as classes with specific effective diameter class limits. The broad classes are sand, silt, and clay, ranging from the larger to the smaller.

Sand as a soil separate consists of mineral soil particles that are 0.05 millimeter to 2 millimeters in diameter. In the table, the estimated sand content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

Silt as a soil separate consists of mineral soil particles that are 0.002 to 0.05 millimeter in diameter. In the table, the estimated silt content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

Clay as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In the table, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of sand, silt, and clay affects the physical behavior of a soil. Particle size is important for engineering and agronomic interpretations, for determination of soil hydrologic qualities, and for soil classification.

The amount and kind of clay affect the fertility and physical condition of the soil and the ability of the soil to adsorb cations and to retain moisture. They influence shrink-swell potential, saturated hydraulic conductivity (Ksat), plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earthmoving operations.

Moist bulk density is the weight of soil (ovendry) per unit volume. Volume is measured when the soil is at field moisture capacity, that is, the moisture content at $^1/_3$- or $^1/_{10}$-bar (33kPa or 10kPa) moisture tension. Weight is determined after the soil is dried at 105 degrees C. In the table, the estimated moist bulk density of each soil horizon is expressed in grams per cubic centimeter of soil material that is less than 2 millimeters in diameter. Bulk density data are used to compute linear extensibility, shrink-swell potential, available water capacity, total pore space, and other soil properties. The moist bulk density of a soil indicates the pore space available for water and roots. Depending on soil texture, a bulk density of more than 1.4 can restrict water storage and root penetration. Moist bulk density is influenced by texture, kind of clay, content of organic matter, and soil structure.

Saturated hydraulic conductivity (Ksat) refers to the ability of a soil to transmit water or air. The estimates in the table indicate the rate of water movement, in inches per hour, when the soil is saturated. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Saturated hydraulic conductivity (Ksat) is considered in the design of soil drainage systems and septic tank absorption fields.

Available water capacity refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each soil layer. The capacity varies, depending on soil properties that affect retention of water. The most important properties are the content of organic matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

Linear extensibility refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. It is an expression of the volume change between the water content of the clod at 1/3- or 1/10-bar tension (33kPa or 10kPa tension) and oven dryness. The volume change is reported in the table as percent change for the whole soil. Volume change is influenced by the amount and type of clay minerals in the soil.

Linear extensibility is used to determine the shrink-swell potential of soils. The shrink-swell potential is low if the soil has a linear extensibility of less than 3 percent; moderate if 3 to 6 percent; high if 6 to 9 percent; and very high if more than 9 percent. If the linear extensibility is more than 3, shrinking and swelling can cause damage to buildings, roads, and other structures and to plant roots. Special design commonly is needed.

Organic matter is the plant and animal residue in the soil at various stages of decomposition. In the table, the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained by returning crop residue to the soil. Organic matter has a positive effect on available water capacity, water infiltration, soil organism activity, and tilth. It is a source of nitrogen and other nutrients for crops and soil organisms.

Erosion factors are shown in the table as the K factor (Kw and Kf) and the T factor. The values of K and T are calculated based on the soil properties provided in the database and the criteria for the factor. Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and saturated hydraulic conductivity (Ksat). Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

Erosion factor Kw indicates the erodibility of the whole soil. The estimates are modified by the presence of rock fragments.

Erosion factor Kf indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

Erosion factor T is an estimate of the maximum average annual rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

Wind erodibility groups are made up of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible. The groups are described in the “National Soil Survey Handbook,” which

is available in local offices of the Natural Resources Conservation Service or on the Internet.

Wind erodibility index is a numerical value indicating the susceptibility of soil to wind erosion, or the tons per acre per year that can be expected to be lost to wind erosion. There is a close correlation between wind erosion and the texture of the surface layer, the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also influence wind erosion.

Chemical Soil Properties

Table 14 shows estimates of some chemical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.

Cation-exchange capacity (CEC) is the total amount of exchangeable cations that can be held by the soil, expressed in terms of centimoles per kilogram. It commonly is measured at neutral pH of 7.0 (CEC-7), but it may be measured at some other stated pH value. Soils that have a low CEC hold fewer cations and may require more frequent applications of fertilizer than those that have a high CEC. The ability to retain cations minimizes the risk of ground-water pollution.

Effective cation-exchange capacity (ECEC) refers to the sum of exchangeable cations plus aluminum, expressed in terms of centimoles per kilogram. It is determined for soils that have natural pH of less than or equal to 5.5 and is a measure of the CEC at the natural pH. In soils with low pH, the ECEC more accurately reflects the actual CEC of the soils. Although CEC-7 is not actually present in these soils under natural conditions, the ECEC reflects the potential CEC if the soils are limed and the pH increased to neutral.

Soil reaction is a measure of acidity or alkalinity. The pH of each soil horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

Calcium carbonate equivalent is the percent of carbonates, by weight, in the fraction of the soil less than 2 millimeters in size. The availability of plant nutrients is influenced by the amount of carbonates in the soil.

Gypsum is expressed as a percent, by weight, of hydrated calcium sulfates in the fraction of the soil less than 20 millimeters in size. Gypsum is partially soluble in water. Soils that have a high content of gypsum may collapse if the gypsum is removed by percolating water.

Salinity is a measure of soluble salts in the soil at saturation. It is expressed as the electrical conductivity of the saturation extract, in millimhos per centimeter at 25 degrees C. Estimates are based on field and laboratory measurements at representative sites of nonirrigated soils. The salinity of irrigated soils is affected by the quality of the irrigation water and by the frequency of water application. Hence, the salinity of soils in individual fields can differ greatly from the value given in the table. Salinity affects the suitability of a soil for crop production, the stability of soil if used as construction material, and the potential of the soil to corrode metal and concrete.

Sodium adsorption ratio (SAR) is a measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg concentration. Soils that have SAR values of 13 or more may be characterized by an increased dispersion of organic matter and clay particles, reduced permeability and aeration, and a general degradation of soil structure.

Water Features

Table 15 gives estimates of various water features. The estimates are used in land use planning that involves engineering considerations.

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The four hydrologic soil groups are:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas.

The *months* in the table indicate the portion of the year in which the feature is most likely to be a concern.

Water table refers to a saturated zone in the soil. The table indicates, by month, depth to the top (*upper limit*) and base (*lower limit*) of the saturated zone in most years. Estimates of the upper and lower limits are based mainly on observations of the water table at selected sites and on evidence of a saturated zone, namely grayish colors or mottles (redoximorphic features) in the soil. A saturated zone that lasts for less than a month is not considered a water table.

Ponding is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation. The table indicates *surface water depth* and the *duration* and *frequency* of ponding. Duration is expressed as *very brief* if less than 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, rare, occasional, and frequent. *None* means that ponding is not probable; *rare* that it is unlikely but possible under unusual weather conditions (the chance of ponding is nearly 0 percent to 5 percent in any year); *occasional* that it occurs, on the average, once or less in 2 years (the chance of ponding is 5 to 50 percent in any year); and *frequent* that it occurs, on the average, more than once in 2 years (the chance of ponding is more than 50 percent in any year).

Flooding is the temporary inundation of an area caused by overflowing streams, by runoff from adjacent slopes, or by tides. Water standing for short periods after rainfall or snowmelt is not considered flooding, and water standing in swamps and marshes is considered ponding rather than flooding.

Duration and *frequency* are estimated. Duration is expressed as *extremely brief* if 0.1 hour to 4 hours, *very brief* if 4 hours to 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, very

rare, rare, occasional, frequent, and very frequent. *None* means that flooding is not probable; *very rare* that it is very unlikely but possible under extremely unusual weather conditions (the chance of flooding is less than 1 percent in any year); *rare* that it is unlikely but possible under unusual weather conditions (the chance of flooding is 1 to 5 percent in any year); *occasional* that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); *frequent* that it is likely to occur often under normal weather conditions (the chance of flooding is more than 50 percent in any year but is less than 50 percent in all months in any year); and *very frequent* that it is likely to occur very often under normal weather conditions (the chance of flooding is more than 50 percent in all months of any year).

The information is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and levels of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

Soil Features

Table 16 gives estimates of various soil features. The estimates are used in land use planning.

A *restrictive layer* is a nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly impede the movement of water and air through the soil or that restrict roots or otherwise provide an unfavorable root environment. Examples are bedrock, cemented layers, dense layers, and frozen layers. The table indicates the hardness and thickness of the restrictive layer, both of which significantly affect the ease of excavation. *Depth to top* is the vertical distance from the soil surface to the upper boundary of the restrictive layer.

Subsidence is the settlement of organic soils or of saturated mineral soils of very low density. Subsidence generally results from either desiccation and shrinkage or oxidation of organic material, or both, following drainage. Subsidence takes place gradually, usually over a period of several years. The table shows the expected initial subsidence, which usually is a result of drainage, and total subsidence, which results from a combination of factors.

Potential for frost action is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil. Temperature, texture, density, saturated hydraulic conductivity (Ksat), content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage to pavements and other rigid structures.

Risk of corrosion pertains to potential soil-induced electrochemical or chemical action that corrodes or weakens uncoated steel or concrete. The rate of corrosion of uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil. Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel or concrete in installations that intersect soil boundaries or soil layers is more susceptible to corrosion than the steel

or concrete in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as *low, moderate,* or *high,* is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion also is expressed as *low, moderate,* or *high*. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

Classification of the Soils

The system of soil classification used by the National Cooperative Soil Survey has six categories (Soil Survey Staff, 1999 and 2010). Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements. The categories are defined in the following paragraphs.

ORDER. Twelve soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in *sol*. An example is Alfisol.

SUBORDER. Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Udalf (*Ud*, meaning humid, plus *alf*, from Alfisol).

GREAT GROUP. Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; type of saturation; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Hapludalfs (*Hapl*, meaning minimal horizonation, plus *udalf*, the suborder of the Alfisols that has a udic moisture regime).

SUBGROUP. Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic subgroup is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other taxonomic class. Each subgroup is identified by one or more adjectives preceding the name of the great group. The adjective *Typic* identifies the subgroup that typifies the great group. An example is Typic Hapludalfs.

FAMILY. Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineralogy class, cation-exchange activity class, soil temperature regime, soil depth, and reaction class. A family name consists of the name of a subgroup preceded by terms that indicate soil properties. An example is fine-loamy, mixed, active, mesic Typic Hapludalfs.

SERIES. The series consists of soils within a family that have horizons similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile.

Table 17 indicates the order, suborder, great group, subgroup, and family of the soil series in the survey area.

Taxonomic Units and Their Morphology

In this section, each taxonomic unit recognized in the survey area is described. Characteristics of the soil and the material in which it formed are identified for each unit. A pedon, a small three-dimensional area of soil, that is typical of the taxonomic unit in the survey area is described. The detailed description of each soil horizon follows standards in the "Soil Survey Manual" (Soil Survey Division Staff, 1993) and in the "Field Book for Describing and Sampling Soils" (Schoeneberger and others, 2012). Many of the technical terms used in the descriptions are defined in "Soil Taxonomy" (Soil Survey Staff, 1999) and in "Keys to Soil Taxonomy" (Soil Survey Staff, 2010). Following the pedon description is the range of important characteristics of the soils in the unit.

Alecanyon Series

Depth class: Very deep
Drainage class: Somewhat excessively drained
Position on landscape: Treads and risers of outwash plains
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of loess and volcanic ash in the upper part
Slope range: 0 to 40 percent
Elevation: 1,980 to 2,550 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Sandy-skeletal, mixed, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 7 inches; brown (10YR 4/3) gravelly ashy coarse sandy loam, very dark brown (10YR 2/2) moist; moderate fine and medium subangular blocky structure; very friable, slightly hard, nonsticky and nonplastic; common very fine and fine roots; many very fine interstitial pores and common very fine tubular pores; 10 percent cobbles and 15 percent rounded gravel; slightly acid; clear smooth boundary.

BA—7 to 11 inches; brown (10YR 4/3) very gravelly ashy coarse sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; very friable, slightly hard, nonsticky and nonplastic; common very fine and fine roots; many very fine interstitial pores and common very fine tubular pores; 20 percent cobbles and 30 percent rounded gravel; slightly acid; abrupt wavy boundary.

BC—11 to 16 inches; yellowish brown (10YR 5/4) extremely cobbly loamy coarse sand, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; very friable, soft, nonsticky and nonplastic; common very fine and few fine roots; common very fine interstitial and tubular pores; 25 percent cobbles, 40 percent gravel, and 2 percent rounded stones; neutral; abrupt wavy boundary.

Bq—16 to 39 inches; variegated extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; common very fine and few fine roots; common very fine and few fine and medium interstitial pores; common patchy distinct very pale brown (10YR 8/3) silica on bottom surfaces of rock fragments; 25 percent cobbles, 45 percent gravel, and 2 percent rounded stones; neutral; clear smooth boundary.

C—39 to 60 inches; variegated very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; common very fine and few fine interstitial pores; 35 percent rounded gravel, 15 percent cobbles, and 2 percent rounded stones; neutral.

Typical Pedon Location

Map unit in which located: Cheney-Alecanyon complex, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 2 miles northeast of Airway Heights, Washington; about 1,400 feet north and 600 feet west of the southeast corner of section 11, T. 25 N., R. 41 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 14 inches
Thickness of volcanic ash influence—10 to 14 inches
Rock fragment content in control section—45 to 75 percent
Depth to sandy-skeletal glacial outwash deposits—10 to 20 inches
Percentage of surface covered with stones—0 to 3 percent

A horizon
Value—4 or 5 dry
Chroma—2 or 3 moist
Texture—ashy coarse sandy loam
Clay content—5 to 15 percent
Gravel content—15 to 30 percent
Cobble content—5 to 25 percent
Total rock fragment content—20 to 35 percent
Reaction—slightly acid, neutral

BA horizon
Value—4 to 6 dry
Clay content—5 to 15 percent
Gravel content—20 to 45 percent
Cobble content—5 to 30 percent
Total rock fragment content—35 to 60 percent
Reaction—slightly acid, neutral

BC horizon
Value—4 to 6 dry
Texture—loamy coarse sand, coarse sandy loam
Clay content—2 to 10 percent
Gravel content—25 to 50 percent
Cobble content—5 to 40 percent
Stone content—0 to 5 percent
Total rock fragment content—45 to 70 percent
Reaction—slightly acid to slightly alkaline

Bq horizon
Texture—loamy coarse sand, coarse sand
Clay content—0 to 4 percent
Gravel content—25 to 75 percent
Cobble content—5 to 50 percent
Stone content—0 to 25 percent
Boulder content—0 to 10 percent
Total rock fragment content—45 to 85 percent
Reaction—neutral, slightly alkaline

C horizon (where present)
Texture—loamy coarse sand, coarse sand
Clay content—0 to 2 percent
Gravel content—25 to 75 percent

Cobble content—5 to 50 percent
Stone content—0 to 25 percent
Boulder content—0 to 10 percent
Total rock fragment content—45 to 85 percent
Reaction—neutral, slightly alkaline

Aquepts

Depth class: Very deep
Drainage class: Poorly drained, very poorly drained
Position on landscape: Drainageways, stream terraces, flood plains
Parent material: Alluvium with loess and volcanic ash in the upper part
Slope range: 0 to 3 percent
Elevation: 2,000 to 2,600 feet
Average annual precipitation: 25 to 30 inches
Average annual air temperature: 43 to 46 degrees F
Frost-free period: 80 to 110 days

Taxonomic class: Aquepts

Representative Pedon

Unless otherwise indicated, colors in the description are for moist soil.

A1—0 to 4 inches; very dark grayish brown (10YR 3/2) ashy loam, grayish brown (10YR 5/2) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; many very fine and fine tubular pores; 2 percent fine mica flakes; slightly acid; clear smooth boundary.

A2—4 to 12 inches; very dark grayish brown (10YR 3/2) ashy loam, light brownish gray (10YR 6/2) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine tubular pores; 2 percent fine faint iron depletions and 2 percent fine distinct masses of oxidized iron; 2 percent fine mica flakes; neutral; gradual smooth boundary.

AB—12 to 17 inches; dark grayish brown (10YR 4/2) ashy loam, light brownish gray (10YR 6/2) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 5 percent fine distinct masses of oxidized iron and 10 percent fine faint iron depletions; 2 percent fine mica flakes; moderately acid; clear smooth boundary.

2Bw—17 to 27 inches; olive brown (2.5Y 4/3) sandy loam, light yellowish brown (2.5Y 6/3) dry; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine roots; many very fine and fine interstitial pores; 5 percent fine distinct masses of oxidized iron and 10 percent fine distinct iron depletions; 2 percent fine mica flakes; 5 percent gravel; moderately acid; abrupt smooth boundary.

2C1—27 to 40 inches; dark grayish brown (2.5Y 4/2) loamy sand, light brownish gray (2.5Y 6/2) dry; massive; slightly hard, friable, nonsticky and nonplastic; few very fine roots; many very fine and fine interstitial pores; 5 percent fine distinct iron depletions and 10 percent fine distinct masses of oxidized iron; 2 percent fine mica flakes; 10 percent gravel; slightly acid; gradual wavy boundary.

2C2—40 to 50 inches; olive brown (2.5Y 4/3) gravelly loamy coarse sand, light yellowish brown (2.5Y 6/3) dry; single grain; loose, nonsticky and nonplastic; many very fine and fine interstitial pores; 20 percent fine faint iron depletions and

20 percent fine distinct masses of oxidized iron; 5 percent fine mica flakes; 30 percent gravel; moderately acid; gradual wavy boundary.

2C3—50 to 60 inches; dark grayish brown (2.5Y 4/2) very gravelly coarse sand, light brownish gray (2.5Y 6/2) dry; single grain; loose, nonsticky and nonplastic; many very fine and fine interstitial pores; 10 percent fine faint iron depletions and 10 percent fine distinct masses of oxidized iron; 5 percent fine mica flakes; 40 percent gravel; slightly acid.

Representative Pedon Location

Map unit in which located: Aquepts ashy loam, frigid, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 230 feet south and 635 feet west of the northeast corner of section 3, T. 23 N., R. 45 E.

Range in Characteristics

Profile

Thickness of volcanic ash influence—12 to 30 inches

Depth to apparent water table—4 to 12 inches in January through May, more than 12 inches in June through December

Depth to redoximorphic features—4 to 8 inches

A1 horizon

Value—3 or 4 moist, 5 or 6 dry

Chroma—1 or 2 moist or dry

Clay content—8 to 12 percent

Gravel content—0 to 10 percent

Reaction—slightly acid, neutral

A2 horizon

Value—3 or 4 moist, 5 or 6 dry

Chroma—1 or 2 moist or dry

Texture—ashy loam, ashy sandy loam

Clay content—8 to 12 percent

Gravel content—0 to 10 percent

Reaction—slightly acid, neutral

AB horizon

Value—3 or 4 moist, 5 or 6 dry

Chroma—1 or 2 moist or dry

Texture—ashy loam, ashy sandy loam

Clay content—8 to 12 percent

Gravel content—0 to 10 percent

Reaction—moderately acid to neutral

2Bw horizon

Hue—2.5Y, 10YR

Value—3 to 5 moist, 5 or 6 dry

Chroma—2 or 3 moist or dry

Texture—sandy loam, loam

Clay content—8 to 12 percent

Gravel content—0 to 10 percent

Reaction—moderately acid to neutral

2C horizon

Hue—7.5YR to 2.5Y, neutral

Value—2.5 to 4 moist, 5 or 6 dry

Chroma—2 or 3 moist or dry
Texture—stratified loamy sand, loamy coarse sand, or coarse sand
Clay content—0 to 5 percent
Gravel content—5 to 40 percent
Cobble content—0 to 10 percent
Total rock fragment content—5 to 50 percent
Reaction—moderately acid to neutral

Ardenvoir Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Mountains, hills
Parent material: Volcanic ash and loess over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 5 to 65 percent
Elevation: 2,190 to 4,300 feet
Average annual precipitation: 25 to 35 inches
Average annual air temperature: 42 to 50 degrees F
Frost-free period: 90 to 140 days

Taxonomic class: Loamy-skeletal, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; undecomposed and decomposed needles and twigs.
Oe—1 to 2 inches; partially decomposed needles and twigs mixed with 1980's Mount St. Helens volcanic ash.
A—2 to 6 inches; brown (10YR 5/3) gravelly ashy silt loam, dark yellowish brown (10YR 3/4) moist; weak very fine and fine granular structure; soft, very friable, nonsticky and slightly plastic; many fine and medium and few coarse roots; many fine irregular pores; 20 percent gravel; neutral; clear wavy boundary.
Bw1—6 to 11 inches; light yellowish brown (10YR 6/4) gravelly ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine, medium, and coarse roots; many very fine and fine tubular pores; 20 percent gravel; slightly acid; gradual wavy boundary.
Bw2—11 to 19 inches; very pale brown (10YR 7/4) gravelly loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few fine to coarse roots; many very fine and fine tubular pores; 20 percent gravel; slightly acid; gradual wavy boundary.
C1—19 to 39 inches; very pale brown (10YR 7/4) very cobbly loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine, medium, and coarse roots; common very fine and fine tubular and irregular pores; 15 percent gravel and 25 percent cobbles; moderately acid; gradual wavy boundary.
C2—39 to 48 inches; very pale brown (10YR 7/3) extremely cobbly loam, light yellowish brown (10YR 6/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine and medium roots; few very fine and fine tubular pores; 25 percent gravel, 45 percent cobbles, and 5 percent flagstones; moderately acid; gradual wavy boundary.
Cr—48 inches; fractured metasedimentary rock.

Typical Pedon Location

Map unit in which located: Huckle-Ardenvoir association, 15 to 35 percent slopes
Location in survey area: Benewah County, Idaho, near Mary Minerva McCroskey Memorial State Park; about 740 feet south and 220 feet west of the northeast corner of section 2, T. 43 N., R. 5 W.

Range in Characteristics

Profile
Depth to bedrock—40 to 60 inches (paralithic)
Depth to material more than 60 percent rock fragments—10 to 20 inches (dry phases)
Thickness of volcanic ash influence—7 to 12 inches

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—5 to 15 percent
Gravel content—15 to 30 percent
Reaction—slightly acid, neutral

AB horizon (where present)
Hue—10YR, 7.5YR
Value—5 dry, 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—5 to 15 percent
Gravel content—15 to 30 percent
Reaction—slightly acid, neutral

Bw horizon
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy silt loam or ashy loam in upper part; loam or silt loam in lower part
Clay content—5 to 15 percent
Gravel content—15 to 45 percent
Channer content—0 to 10 percent
Cobble content—0 to 45 percent
Total rock fragment content—20 to 70 percent
Reaction—slightly acid, neutral

C horizon
Hue—10YR, 2.5Y
Value—7 or 8 dry, 5 to 7 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam, sandy loam
Clay content—5 to 10 percent
Gravel content—15 to 45 percent
Channer content—0 to 70 percent
Cobble content—15 to 45 percent
Stone content—0 to 35 percent
Flagstone content—0 to 15 percent
Total rock fragment content—40 to 85 percent
Reaction—strongly acid to slightly acid

Ardtoo Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes and summits of mountains and hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, gneiss, and schist
Slope range: 3 to 60 percent
Elevation: 2,000 to 4,800 feet
Average annual precipitation: 25 to 35 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Loamy-skeletal, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, leaves, and twigs.
A—1 to 4 inches; brown (10YR 5/3) gravelly ashy sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine, fine, and medium roots; many very fine and fine irregular pores; 20 percent gravel; slightly acid; clear smooth boundary.
Bw1—4 to 7 inches; brown (10YR 5/3) gravelly ashy sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine and medium subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine, fine, and medium roots; common fine tubular pores and many very fine and fine irregular pores; 20 percent gravel; slightly acid; clear wavy boundary.
Bw2—7 to 15 inches; pale brown (10YR 6/3) very gravelly ashy sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; common fine tubular pores and common very fine and fine irregular pores; 25 percent gravel and 10 percent cobbles; slightly acid; clear wavy boundary.
Bw3—15 to 21 inches; very pale brown (10YR 7/3) very cobbly sandy loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine and few medium and coarse roots; common fine tubular pores and many very fine and fine irregular pores; 10 percent fine and medium mica flakes; 25 percent gravel and 20 percent cobbles; slightly acid; gradual wavy boundary.
BC—21 to 37 inches; very pale brown (10YR 8/2) very gravelly coarse sandy loam, very pale brown (10YR 7/3) moist; weak coarse subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine and fine irregular pores; 10 percent fine and medium mica flakes; 40 percent gravel and 10 percent cobbles; strongly acid; gradual wavy boundary.
C—37 to 51 inches; very pale brown (10YR 8/2) very gravelly loamy coarse sand, very pale brown (10YR 7/3) moist; massive, slightly hard, friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; many very fine and fine irregular pores; 10 percent fine and medium mica flakes; 50 percent gravel and 5 percent cobbles; strongly acid; clear wavy boundary.
Cr—51 inches; moderately weathered granite.

Typical Pedon Location

Map unit in which located: Blackprince-Ardtoo complex, 30 to 60 percent slopes
Location in survey area: Spokane County, Washington, about 5 miles southeast of Elk, Washington; about 130 feet east and 2,310 feet north of the southwest corner of section 7, T. 29 N., R. 45 E.

Range in Characteristics

Profile
Depth to bedrock—40 to 60 inches (paralithic)
Thickness of volcanic ash influence—7 to 20 inches

A horizon
Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 moist or dry
Clay content—4 to 8 percent
Gravel content—15 to 25 percent
Reaction—slightly acid, neutral

Bw1 and Bw2 horizons
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy coarse sandy loam
Clay content—4 to 8 percent
Gravel content—20 to 35 percent
Cobble content—0 to 10 percent
Total rock fragment content—20 to 45 percent
Reaction—slightly acid, neutral

Bw3 horizon
Hue—10YR, 7.5YR
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, coarse sandy loam
Clay content—6 to 10 percent
Gravel content—25 to 35 percent
Cobble content—10 to 25 percent
Total rock fragment content—35 to 55 percent
Reaction—moderately acid, slightly acid

BC horizon
Hue—2.5Y, 10YR
Value—7 or 8 dry, 5 to 7 moist
Chroma—2 to 4 dry, 3 or 4 moist
Texture—coarse sandy loam
Clay content—4 to 8 percent
Gravel content—35 to 50 percent
Cobble content—0 to 15 percent
Stone content—0 to 10 percent
Total rock fragment content—35 to 75 percent
Reaction—strongly acid to slightly acid

C horizon
Hue—10YR, variegated
Value—7 or 8 dry, 6 or 7 moist
Chroma—2 or 3 dry, 3 moist
Texture—loamy coarse sand, coarse sandy loam
Clay content—2 to 5 percent
Gravel content—35 to 55 percent
Cobble content—0 to 20 percent
Stone content—0 to 10 percent
Total rock fragment content—35 to 75 percent
Reaction—strongly acid to slightly acid

Arson Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes of mountains and hills
Parent material: Volcanic ash and loess over colluvium and residuum derived from siltite and fine-grained quartzite
Slope range: 10 to 40 percent
Elevation: 2,250 to 3,600 feet
Average annual precipitation: 25 to 33 inches
Average annual air temperature: 42 to 49 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Fine-loamy, mixed, superactive, frigid Vitrandic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, twigs, leaves, bark, and cones.
Oe—1 to 2 inches; moderately decomposed organic matter mixed with 1980's Mount St. Helens volcanic ash.
A—2 to 5 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; moderate very fine and fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine and few medium tubular pores; 2 percent gravel; slightly acid; clear smooth boundary.
BA—5 to 9 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine and few medium and coarse tubular pores; 2 percent gravel; slightly acid; clear smooth boundary.
EBt—9 to 15 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; moderate medium and coarse angular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine and few medium and coarse tubular pores; few faint clay films on peds and in pores; 5 percent gravel; moderately acid; gradual wavy boundary.
Bt1—15 to 27 inches; yellowish brown (10YR 5/4) and light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak coarse prismatic structure parting to moderate medium angular blocky; hard, firm, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine and fine, common medium, and few coarse tubular pores; common faint and few

distinct clay films on faces of peds and in pores; few faint and distinct silt coatings on faces of peds and in pores; 10 percent gravel and 5 percent paragravel; moderately acid; gradual wavy boundary.

Bt2—27 to 38 inches; yellowish brown (10YR 5/4) and light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak coarse and very coarse prismatic structure parting to moderate medium and coarse angular blocky; hard, firm, moderately sticky and slightly plastic; few fine and medium roots; many very fine and fine, common medium, and few coarse tubular pores; common faint and distinct clay films that are brown (7.5YR 5/4 and 4/4) when dry and on faces of peds and in pores; few faint and distinct silt coatings on faces of peds and in pores; 10 percent gravel and 5 percent paragravel; strongly acid; clear wavy boundary.

2Bt3—38 to 43 inches; yellowish brown (10YR 5/4) extremely gravelly silt loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few fine roots; common very fine and fine and few medium and coarse tubular and irregular pores; common faint and distinct clay films that are light brown (7.5YR 6/4) and brown (7.5YR 5/4) when dry and on faces of peds, in pores, and on rock fragments; few faint and distinct silt coatings on faces of peds; 45 percent gravel, 10 percent paragravel, and 10 percent cobbles; strongly acid; gradual wavy boundary.

2BCt—43 to 57 inches; light brown (10YR 6/4) very gravelly silt loam, dark yellowish brown (10YR 4/4 and 5/4) moist; weak fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few fine roots; common very fine and fine and few medium and coarse tubular and irregular pores; common distinct and prominent clay films that are brown (7.5YR 4/4) and reddish brown (5YR 5/4) when dry and on rock fragments; few faint and distinct silt coatings on faces of peds; 35 percent gravel, 10 percent paragravel, and 5 percent cobbles; strongly acid; clear irregular boundary.

2Crt—57 inches; weathered, fractured siltite.

Typical Pedon Location

Map unit in which located: Arson-Lotuspoint complex, 10 to 40 percent slopes

Location in survey area: Benewah County, Idaho, about 5 miles northwest of the town of St. Maries, Idaho; about 870 feet north and 2,480 feet west of the southeast corner of section 29, T. 47 N., R. 2 W.

Range in Characteristics

Profile

Depth to bedrock—40 to 60 inches (paralithic)
Thickness of volcanic ash influence—7 to 10 inches

A horizon

Value—4 to 6 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—10 to 18 percent
Gravel content—0 to 5 percent
Reaction—moderately acid, slightly acid

BA horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 dry or moist
Clay content—12 to 20 percent
Gravel content—0 to 5 percent
Reaction—moderately acid, slightly acid

EBt horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Clay content—17 to 23 percent
Gravel content—0 to 5 percent

Bt horizon
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Clay content—18 to 26 percent
Gravel content—0 to 10 percent
Paragravel content—0 to 5 percent
Total rock fragment content—0 to 10 percent
Reaction—strongly acid, moderately acid

2Bt and 2BCt horizons
Hue—10YR, 7.5YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—4 dry or moist
Texture—silt loam, loam
Clay content—16 to 26 percent
Gravel content—30 to 50 percent
Cobble content—0 to 10 percent
Paragravel content—0 to 25 percent
Total rock fragment content—30 to 70 percent
Reaction—strongly acid, moderately acid

Athena Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Loess hills
Parent material: Loess
Slope range: 0 to 60 percent
Elevation: 2,100 to 2,750 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 48 to 52 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Pachic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Ap—0 to 4 inches; very dark grayish brown (10YR 3/2) silt loam, dark grayish brown (10YR 4/2) dry; weak medium platy structure breaking to moderate medium granular; very friable, soft, slightly sticky and slightly plastic; many very fine and common fine roots throughout; common very fine tubular pores; neutral; abrupt smooth boundary.
A1—4 to 8 inches; very dark brown (10YR 2/2) silt loam, dark grayish brown (10YR 4/2) dry; moderate medium and coarse granular structure; very friable, soft, slightly sticky and slightly plastic; many very fine and few fine roots throughout; common very fine irregular pores; neutral; clear wavy boundary.
A2—8 to 13 inches; very dark grayish brown (10YR 3/2) silt loam, brown (10YR 4/3) dry; moderate fine and medium granular structure; very friable, soft, slightly sticky

and slightly plastic; common very fine roots throughout; common very fine irregular pores; neutral; clear wavy boundary.

ABt—13 to 26 inches; dark brown (10YR 3/3) silt loam, dark yellowish brown (10YR 4/4) dry; moderate medium subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; common very fine roots throughout; common very fine irregular pores; 1 percent faint patchy clay films in pores; neutral; clear wavy boundary.

Bt1—26 to 42 inches; dark yellowish brown (10YR 4/4) silt loam, yellowish brown (10YR 5/4) dry; moderate medium subangular blocky structure; friable, slightly hard, moderately sticky and moderately plastic; common very fine roots throughout; common very fine irregular pores; 5 percent faint patchy clay films on faces of peds; slightly alkaline; clear wavy boundary.

Bt2—42 to 54 inches; dark yellowish brown (10YR 4/4) silt loam, yellowish brown (10YR 5/4) dry; moderate medium subangular blocky structure; friable, slightly hard, slightly sticky and moderately plastic; few very fine roots throughout; few very fine irregular pores; 1 percent faint patchy clay films on faces of peds; moderately alkaline; clear wavy boundary.

Bt3—54 to 60 inches; dark yellowish brown (10YR 3/4) silt loam, yellowish brown (10YR 5/4) dry; moderate medium subangular blocky structure; friable, slightly hard, slightly sticky and moderately plastic; few very fine roots throughout; few very fine irregular pores; 1 percent faint patchy clay films on faces of peds; moderately alkaline.

Typical Pedon Location

Map unit in which located: Athena silt loam, 8 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 7,000 feet south and 163 feet west of the intersection of Martin and Reed Roads; about 1,074 feet north and 2,345 feet east of the southwest corner of section 34, T. 21 N., R. 40 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—20 to 40 inches
Depth to secondary carbonates (where present)—more than 43 inches
Clay content in particle-size control section—18 to 27 percent

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—silt loam
Clay content—16 to 22 percent
Reaction—strongly acid to neutral

Bt or Bw horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—18 to 27 percent
Gravel content—0 to 5 percent
Reaction—neutral to moderately alkaline

Bk horizon

Below a depth of 43 inches in some pedons

Bellslake Series

Depth class: Very deep
Drainage class: Very poorly drained
Position on landscape: Depressions of low stream terraces and flood plains
Parent material: Alluvium mixed with volcanic ash and loess over decomposed herbaceous material
Slope range: 0 to 3 percent
Elevation: 1,820 to 2,190 feet
Average annual precipitation: 20 to 25 inches
Average annual air temperature: 42 to 46 degrees F
Frost-free period: 80 to 120 days

Taxonomic class: Coarse-silty, mixed, superactive, nonacid, frigid Aquandic Humaquepts

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Ag1—0 to 6 inches; black (10YR 2/1) mucky ashy silt loam, dark gray (10YR 4/1) dry; moderate fine and medium granular structure; friable, slightly hard, slightly sticky and slightly plastic; many fine and medium roots; many fine and medium irregular pores; 20 percent medium prominent masses of oxidized iron that are strong brown (7.5YR 4/6) moist; 12 percent organic matter; slightly acid; abrupt wavy boundary.

Ag2—6 to 10 inches; very dark grayish brown (10YR 3/2), stratified mucky ashy silt loam to very fine sandy loam, grayish brown (10YR 5/2) dry; weak medium subangular blocky structure; friable, slightly hard, nonsticky and nonplastic; common fine and medium roots; common fine and medium irregular pores; 10 percent medium prominent strong brown (7.5YR 4/6) masses of oxidized iron and 20 percent fine distinct light brownish gray (10YR 6/2) iron depletions; 10 percent organic matter; slightly acid; abrupt wavy boundary.

A—10 to 18 inches; dark brown (10YR 3/3), stratified mucky ashy silt loam to very fine sandy loam, brown (10YR 5/3) dry; weak medium subangular blocky structure; friable, slightly hard, nonsticky and nonplastic; common fine and medium roots; common fine and medium irregular pores; 5 percent medium distinct masses of oxidized iron, strong brown (7.5YR 4/6) moist, and 5 percent fine distinct iron depletions, light brownish gray (10YR 6/2) moist; 10 percent organic matter; slightly acid; abrupt wavy boundary.

Bg—18 to 30 inches; dark grayish brown (10YR 4/2) mucky silt loam, light brownish gray (10YR 6/2) dry; weak coarse subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; common fine roots; common fine and medium irregular pores; 5 percent distinct medium masses of oxidized iron, dark brown (7.5YR 3/4) moist, and 5 percent prominent medium masses of oxidized iron, strong brown (7.5YR 4/6) moist; 12 percent organic matter; slightly acid; abrupt wavy boundary.

Oa—30 to 48 inches; muck (highly decomposed plant material) that is very dark gray (10YR 3/1) and brown (10YR 4/3) broken face, black (10YR 2/1) rubbed; 10 percent fiber, 1 percent rubbed; 20 percent mineral material; massive; nonsticky and nonplastic; few very fine roots; moderately acid; abrupt wavy boundary.

Oe1—48 to 55 inches; mucky peat (moderately decomposed plant material) that is dark yellowish brown (10YR 4/4) broken face, very dark grayish brown (10YR 3/2) rubbed; about 60 percent fiber, 10 percent rubbed; massive; nonsticky and nonplastic; few very fine roots; moderately acid; strong presence of hydrogen sulfide; abrupt wavy boundary.

Oe2—55 to 65 inches; mucky peat (moderately decomposed plant material) that is dark yellowish brown (10YR 4/6) broken face, very dark brown (10YR 2/2) rubbed; about 75 percent fiber, 40 percent rubbed; massive; few very fine roots; moderately acid; strong presence of hydrogen sulfide.

Typical Pedon Location

Map unit in which located: Pywell-Bellslake complex, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 5 miles north of Moab, Washington; about 1,920 feet east and 1,160 feet south of the northwest corner of section 34, T. 27 N., R. 45 E.

Range in Characteristics

Profile
Thickness of umbric epipedon—10 to 20 inches
Depth to apparent water table—surface to a depth of 12 inches in January through June, more than 6 inches in July through September
Depth to redoximorphic features—0 to 10 inches
Thickness of volcanic ash influence—7 to 18 inches
Depth to organic material—30 to 45 inches
Reaction—strongly acid to slightly acid

Ag horizon
Value—2 or 3 moist, 4 or 5 dry
Chroma—1 or 2 moist or dry
Texture—ashy silt loam, mucky ashy silt loam, stratified mucky ashy silt loam to very fine sandy loam
Content of clay—8 to 12 percent
Contrast class of redoximorphic features—distinct or prominent

A horizon
Clay content—8 to 12 percent

Bg horizon
Chroma—1 or 2 moist or dry
Texture—mucky silt loam, silt loam, ashy silt loam, mucky ashy silt loam
Content of clay—8 to 12 percent
Contrast class of redoximorphic features—distinct or prominent

Oa horizon
Value—2 to 4 moist
Chroma—1 to 3 moist
Content of unrubbed fiber—10 to 30 percent
Content of rubbed fiber—1 to 10 percent
Content of wood fragments—0 to 5 percent

Oe horizon
Value—2 to 4 dry or moist
Chroma—2 to 6 moist
Content of unrubbed fiber—60 to 85 percent
Content of rubbed fiber—10 to 45 percent
Content of wood fragments—0 to 5 percent

Blackprince Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Shoulders and backslopes of mountains and hills

Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite
Slope range: 8 to 60 percent
Elevation: 1,800 to 4,000 feet
Average annual precipitation: 21 to 35 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Loamy-skeletal, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 0.5 inch; slightly decomposed twigs, leaves, grass, cones, and needles.
Oe—0.5 to 1 inch; moderately decomposed plant material.
A—1 to 5 inches; brown (10YR 5/3) gravelly ashy coarse sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine tubular and irregular pores; 25 percent gravel; slightly acid; clear wavy boundary.
Bw—5 to 19 inches; brown (10YR 5/3) very gravelly ashy sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular and irregular pores; 40 percent gravel; moderately acid; gradual wavy boundary.
Bt—19 to 26 inches; pale brown (10YR 6/3) very gravelly coarse sandy loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; 2 percent distinct clay films on surface of peds, one 2-millimeter-thick lamella that is brown (7.5YR 5/4) moist; few very fine and fine roots; common very fine and fine irregular pores and few fine tubular pores; 2 percent very fine mica flakes; 50 percent gravel; moderately acid; gradual wavy boundary.
BCt—26 to 36 inches; very pale brown (10YR 7/3) very gravelly loamy coarse sand, light yellowish brown (10YR 6/4) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; two discontinuous 2-millimeter-thick lamellae that are brown (7.5YR 4/4) moist; few very fine and fine roots; common very fine and fine irregular pores; 2 percent very fine mica flakes; 55 percent gravel; moderately acid; clear wavy boundary.
Cr—36 inches; highly weathered granite.

Typical Pedon Location

Map unit in which located: Blackprince-Ardtoo complex, 30 to 60 percent slopes
Location in survey area: Spokane County, Washington, about 6 miles east of Elk, Washington; about 1,750 feet east and 1,560 feet north of the southwest corner of section 17, T. 29 N., R. 45 E.

Range in Characteristics

Profile
Depth to bedrock—20 to 40 inches (paralithic)
Thickness of volcanic ash influence—9 to 20 inches

A horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Clay content—6 to 12 percent

Gravel content—15 to 25 percent
Reaction—slightly acid, neutral

Bw horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy coarse sandy loam
Clay content—6 to 12 percent
Gravel content—35 to 45 percent
Reaction—moderately acid, slightly acid

Bt horizon
Hue—10YR, 7.5YR
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—coarse sandy loam, sandy loam
Clay content—6 to 12 percent
Gravel content—40 to 55 percent
Cobble content—0 to 5 percent
Total rock fragment content—40 to 55 percent
Reaction—moderately acid, slightly acid

BC and BCt horizons
Hue—2.5Y, 10YR
Value—5 or 6 moist
Chroma—3 or 4 dry or moist
Texture—loamy coarse sand, sandy loam, coarse sandy loam
Clay content—0 to 5 percent
Gravel content—40 to 60 percent
Cobble content—0 to 10 percent
Total rock fragment content—40 to 60 percent
Reaction—moderately acid, slightly acid

A C horizon is in some pedons.

Bobbitt Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes and summits of basalt plateaus
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 0 to 25 percent
Elevation: 1,900 to 2,700 feet
Average annual precipitation: 18 to 23 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, isotic, mesic Vitrandic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, leaves, and twigs.
Oe—1 to 2 inches; moderately decomposed needles, leaves, and twigs mixed with 1980's Mount St. Helens volcanic ash.

A—2 to 6 inches; brown (10YR 5/3) cobbly ashy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; many fine tubular pores and many very fine irregular pores; 10 percent gravel, 15 percent cobbles, and 2 percent stones; neutral; clear wavy boundary.

AB—6 to 16 inches; brown (10YR 5/3) very cobbly ashy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; many very fine and fine and common medium and coarse roots; common very fine and fine tubular pores; 25 percent gravel and 30 percent cobbles; neutral; clear wavy boundary.

Bt—16 to 33 inches; yellowish brown (10YR 5/4) extremely cobbly loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, firm, moderately sticky and moderately plastic; common very fine, fine, and medium and few coarse roots; common very fine and fine tubular pores; 40 percent faint clay films on faces of peds; 20 percent gravel, 50 percent cobbles, and 5 percent stones; slightly acid; abrupt wavy boundary.

BCt—33 to 38 inches; strong brown (7.5YR 5/6) and brown (10YR 5/3) extremely cobbly clay loam, brown (7.5YR 4/4) and dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; very hard, very firm, moderately sticky and moderately plastic; few very fine and fine roots; few very fine tubular pores; 20 percent distinct clay films on rock fragments; 10 percent gravel and 65 percent cobbles; slightly acid; clear wavy boundary.

R—38 inches; unweathered basalt.

Typical Pedon Location

Map unit in which located: Bobbitt-Lacy complex, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 0.75 mile north of Valleyford, Washington; about 440 feet west and 1,290 feet south of the northeast corner of section 28, T. 24 N., R. 44 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—7 to 18 inches
Thickness of volcanic ash influence—7 to 14 inches
Depth to bedrock—20 to 40 inches (lithic)

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—10 to 20 percent
Gravel content—5 to 10 percent
Cobble content—10 to 25 percent
Stone content—0 to 2 percent
Total rock fragment content—15 to 30 percent
Reaction—slightly acid, neutral

AB horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy loam, ashy silt loam
Clay content—10 to 20 percent
Gravel content—15 to 30 percent
Cobble content—15 to 30 percent

Stone content—0 to 2 percent
Total rock fragment content—30 to 55 percent
Reaction—slightly acid, neutral

Bt horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam
Clay content—18 to 24 percent
Gravel content—15 to 30 percent
Cobble content—20 to 50 percent
Stone content—0 to 5 percent
Total rock fragment content—35 to 85 percent
Reaction—moderately acid to neutral

BCt horizon
Hue—10YR, 7.5YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 to 6 dry, 2 to 4 moist
Texture—clay loam, loam
Clay content—20 to 30 percent
Gravel content—10 to 30 percent
Cobble content—30 to 65 percent
Stone content—0 to 5 percent
Total rock fragment content—55 to 85 percent
Reaction—moderately acid to neutral

Bong Series

Depth class: Very deep
Drainage class: Somewhat excessively drained
Position on landscape: Treads, risers, and escarpments of outwash plains
Parent material: Sandy glaciofluvial deposits mixed with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 30 percent
Elevation: 1,600 to 2,500 feet
Average annual precipitation: 15 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Sandy, mixed, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 11 inches; dark grayish brown (10YR 4/2) ashy sandy loam, very dark brown (10YR 2/2) moist; weak medium granular structure; slightly hard, friable, nonsticky and nonplastic; common fine roots; many fine interstitial and tubular pores; neutral; clear smooth boundary.

Bw—11 to 22 inches; yellowish brown (10YR 5/4) sandy loam, brown (7.5YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common fine roots; many fine irregular pores; neutral; clear wavy boundary.

BC—22 to 28 inches; pale brown (10YR 6/3) gravelly coarse sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common fine roots; few fine irregular pores; 20 percent gravel; neutral; abrupt wavy boundary.
C—28 to 60 inches; multicolored coarse sand; single grain; loose, nonsticky and nonplastic; 10 percent gravel; neutral.

Typical Pedon Location

Map unit in which located: Bong-Phoebe, dry, complex, 8 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 0.2 mile north of the junction of Dover Road and Sunset Highway and 50 feet west in cultivated field; about 1,150 feet north and 50 feet west of the southeast corner of section 20, T. 25 N., R. 41 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—8 to 16 inches
Thickness of volcanic ash influence—10 to 16 inches
Depth to loamy sand or sand—15 to 30 inches
Rock fragment content in particle-size control section—averages 5 to 30 percent
Sand content in particle-size control section—more than 70 percent
Hue—10YR, 7.5YR, 2.5Y

Ap or A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—5 to 10 percent
Gravel content—0 to 15 percent
Reaction—slightly acid, neutral

Bw horizon
Value—4 to 6 dry, 2 to 4 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, coarse sandy loam
Clay content—5 to 10 percent
Gravel content—0 to 15 percent
Reaction—slightly acid to slightly alkaline

BC horizon (where present)
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loamy coarse sand, coarse sandy loam
Clay content—2 to 8 percent
Gravel content—5 to 30 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 30 percent
Reaction—slightly acid to slightly alkaline

C horizon
Texture—coarse sand
Clay content—0 to 5 percent
Gravel content—5 to 35 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 40 percent
Reaction—slightly acid to slightly alkaline

Bonner Taxadjunct

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash terraces
Parent material: Thick mantle of volcanic ash mixed with loess over outwash
Slope range: 0 to 15 percent
Elevation: 1,900 to 2,400 feet
Average annual precipitation: 22 to 26 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Ashy over sandy or sandy-skeletal, glassy over isotic, frigid Typic Vitrixerands

Taxadjunct Features

The Bonner soils in this survey area are a taxadjunct to the series because they do not meet the criteria for the aniso classification. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, leaves, and twigs.
Oe—1 to 3 inches; moderately decomposed needles, leaves, and twigs.
A—3 to 5 inches; grayish brown (10YR 5/2) ashy fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine, common medium, and few coarse roots; common very fine and fine and few medium irregular and tubular pores; 5 percent gravel; neutral; clear smooth boundary.
Bw1—5 to 9 inches; yellowish brown (10YR 5/4) ashy fine sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine and fine and few medium irregular and tubular pores; 10 percent gravel; neutral; clear smooth boundary.
Bw2—9 to 19 inches; yellowish brown (10YR 5/4) ashy fine sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine roots; common fine and medium tubular and irregular pores; 10 percent gravel; slightly acid; clear smooth boundary.
2BC—19 to 27 inches; light yellowish brown (10YR 6/4) very gravelly loamy sand, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and medium roots; common fine interstitial pores; 40 percent gravel and 5 percent cobbles; slightly acid; abrupt smooth boundary.
2C—27 to 60 inches; variegated extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few medium roots; many very fine and fine interstitial pores; 60 percent gravel, 5 percent cobbles, and 2 percent stones; slightly acid.

Typical Pedon Location

Map unit in which located: Bonner ashy fine sandy loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 1 mile east of Pocahontas Bay on Eloika Lake, Washington; about 1,750 feet south and 1,850 feet west of the northeast corner of section 10, T. 29 N., R. 43 E.

Range in Characteristics

Profile
Thickness of ochric epipedon—2 to 8 inches
Thickness of volcanic ash mantle—15 to 25 inches
Depth to sandy-skeletal horizon—15 to 29 inches from mineral soil surface
Reaction—slightly acid or neutral throughout

A horizon
Value—4 or 5 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Clay content—4 to 8 percent
Gravel content—5 to 10 percent

Bw1 horizon
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—4 to 8 percent
Gravel content—5 to 15 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 15 percent

Bw2 horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Texture—ashy fine sandy loam, ashy sandy loam, ashy coarse sandy loam
Clay content—4 to 8 percent
Gravel content—5 to 25 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 30 percent

2BC horizon
Value—4 to 6 dry or moist
Clay content—0 to 5 percent
Gravel content—25 to 45 percent
Cobble content—0 to 5 percent
Total rock fragment content—25 to 50 percent

2C horizon
Hue—10YR, 2.5Y
Value—4 or 5 moist, variegated
Chroma—3 or 4 dry or moist, variegated
Texture—coarse sand, loamy coarse sand
Clay content—0 to 3 percent
Gravel content—35 to 80 percent
Cobble content—5 to 15 percent
Stone content—0 to 5 percent
Total rock fragment content—40 to 85 percent

Bouldercreek Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes and footslopes of mountains
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from gneiss and schist

Slope range: 3 to 70 percent
Elevation: 1,970 to 5,000 feet
Average annual precipitation: 30 to 42 inches
Average annual air temperature: 41 to 45 degrees F
Frost-free period: 60 to 120 days

Taxonomic class: Ashy over loamy-skeletal, amorphic over isotic, frigid Typic Udivitrands

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 2 inches; slightly decomposed needles, leaves, cones, and twigs.
Oe—2 to 3 inches; decomposed organic matter mixed with 1980's Mount St. Helens volcanic ash.
A—3 to 9 inches; brown (7.5YR 5/4) ashy silt loam, dark brown (7.5YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and common fine and medium roots; many very fine and fine irregular and tubular pores; 10 percent gravel; slightly acid; clear wavy boundary.
Bw1—9 to 19 inches; light brown (7.5YR 6/4) ashy silt loam, brown (7.5YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine irregular and tubular pores; 5 percent gravel; slightly acid; clear wavy boundary.
Bw2—19 to 25 inches; light brown (7.5YR 6/4) ashy silt loam, brown (7.5YR 4/4) moist; weak coarse subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine irregular and tubular pores; 5 percent gravel; slightly acid; abrupt wavy boundary.
2Bw3—25 to 33 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few faint discontinuous clay films on faces of peds; common very fine and fine and few medium roots; common very fine irregular pores and few fine tubular pores; 40 percent gravel and 10 percent cobbles; moderately acid; clear wavy boundary.
2BC—33 to 50 inches; light yellowish brown (10YR 6/4) extremely cobbly sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few faint discontinuous clay films between sand grains; few very fine, fine, and medium roots; many very fine irregular pores; 15 percent very fine mica flakes; 25 percent gravel, 30 percent cobbles, and 10 percent stones; moderately acid; gradual wavy boundary.
2C—50 to 63 inches; light yellowish brown (10YR 6/4) extremely stony sandy loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; many very fine and fine irregular pores; less than 10 percent very fine mica flakes; 25 percent gravel, 20 percent cobbles, and 30 percent stones; moderately acid.

Typical Pedon Location

Map unit in which located: Bouldercreek ashy silt loam, 30 to 60 percent slopes
Location in survey area: Spokane County, Washington, about 1.5 miles northeast of Mica Peak, in Liberty Lake Regional Park; about 1,690 feet south and 3,430 feet east of the northwest corner of section 12, T. 24 N., R. 45 E.

Range in Characteristics

Profile
Depth to bedrock—more than 60 inches
Thickness of volcanic ash mantle—14 to 24 inches

A horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Clay content—3 to 8 percent
Gravel content—0 to 10 percent
Reaction—moderately acid to neutral

Bw horizon
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Clay content—3 to 8 percent
Gravel content—5 to 25 percent
Cobble content—0 to 5 percent in the lower part
Reaction—moderately acid to neutral

2Bw horizon
Hue—10YR, 7.5YR
Value—6 or 7 dry, 3 to 5 moist
Chroma—3 to 6 dry or moist
Texture—loam, sandy loam, coarse sandy loam
Clay content—10 to 14 percent
Gravel content—30 to 45 percent
Cobble content—5 to 20 percent
Stone content—0 to 5 percent
Total rock fragment content—35 to 60 percent
Reaction—strongly acid to slightly acid

2C horizon
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, loamy sand, coarse sandy loam
Clay content—3 to 8 percent
Gravel content—20 to 40 percent
Cobble content—10 to 40 percent
Stone content—10 to 40 percent
Total rock fragment content—70 to 85 percent
Reaction—strongly acid to slightly acid

Boulderjud Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes and footslopes of mountains and hills
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from quartz-monzonite, gneiss, and other granitic rock
Slope range: 15 to 60 percent
Elevation: 2,200 to 4,800 feet
Average annual precipitation: 25 to 42 inches

Average annual air temperature: 42 to 46 degrees F
Frost-free period: 80 to 120 days

Taxonomic class: Ashy over loamy-skeletal, amorphic over isotic, frigid Typic Udivitrands (fig. 21)

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 1 inch; slightly decomposed needles and twigs.
Oe—1 to 2 inches; moderately decomposed organic matter.
A—2 to 6 inches; dark brown (7.5YR 3/4) ashy silt loam, brown (7.5YR 5/4) dry; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular and tubular pores; 5 percent fine gravel; neutral; clear wavy boundary.
Bw—6 to 16 inches; dark yellowish brown (10YR 4/6) ashy silt loam, brownish yellow (10YR 6/6) dry; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; common very fine and fine irregular and tubular pores; 10 percent fine gravel; neutral; abrupt wavy boundary.
2Bt—16 to 26 inches; brown (10YR 4/3) very gravelly sandy loam, pale brown (10YR 6/3) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 5 percent distinct clay bridging sand grains; 35 percent fine and 10 percent medium gravel; neutral; clear wavy boundary.

Figure 21.—Typical profile of a Boulderjud soil. Numerals on tape indicate feet.

2BC—26 to 36 inches; yellowish brown (10YR 5/6) very gravelly sandy loam, very pale brown (10YR 7/4) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; many fine interstitial pores; 35 percent gravel and 10 percent cobbles; 10 percent fine mica flakes; neutral; gradual wavy boundary.
2C—36 to 56 inches; light olive brown (2.5Y 5/3) very gravelly loamy sand, pale yellow (2.5Y 8/3) dry; massive; slightly hard, friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 30 percent gravel and 20 percent cobbles; 10 percent fine and medium mica flakes; neutral; clear irregular boundary.
2Cr—56 inches; weakly cemented, highly weathered granitic rock.

Typical Pedon Location

Map unit in which located: Boulderjud ashy silt loam, 30 to 60 percent slopes
Location in survey area: Spokane County, Washington, about 4 miles east of Elk, Washington; about 2,600 feet east and 650 feet south of the northwest corner of section 17, T. 29 N., R. 45 E.

Range in Characteristics

Profile
Depth to bedrock—40 to 60 inches (paralithic)
Depth to bedrock—more than 60 to 80 inches (lithic)
Thickness of volcanic ash mantle—14 to 25 inches

A horizon
Hue—10YR, 7.5YR
Value—2 to 4 moist, 3 to 5 dry
Chroma—2 to 4 moist or dry
Fine gravel content—0 to 5 percent
Reaction—slightly acid, neutral

Bw horizon
Hue—10YR, 7.5YR
Value—3 or 4 moist, 4 to 6 dry
Chroma—4 to 6 moist or dry
Clay content—2 to 6 percent
Fine gravel content—0 to 10 percent
Reaction—slightly acid, neutral

2Bt or 2Bw horizon
Hue—10YR, 7.5YR
Value—3 to 5 moist, 4 to 7 dry
Chroma—3 to 6 dry or moist
Texture—sandy loam, loam
Clay content—4 to 8 percent
Gravel content—15 to 45 percent
Cobble content—0 to 20 percent
Total rock fragment content—40 to 60 percent
Description of lamellae—few thin faint discontinuous in some pedons
Reaction—strongly acid to neutral

2C horizon (where present)
Hue—10YR, 2.5Y
Value—4 to 6 moist, 6 to 8 dry
Chroma—3 or 4 dry or moist
Texture—loamy sand, loamy coarse sand
Clay content—2 to 5 percent
Gravel content—25 to 55 percent

Cobble content—0 to 20 percent
Total rock fragment content—40 to 60 percent
Reaction—strongly acid to neutral

Brevco Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes, summits, and shoulders of mountains and hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite or gneiss
Slope range: 3 to 60 percent
Elevation: 2,000 to 5,000 feet
Average annual precipitation: 20 to 35 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Loamy-skeletal, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material.
A—1 to 4 inches; grayish brown (10YR 5/2) gravelly ashy sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium granular structure; soft, friable, nonsticky and slightly plastic; common very fine and fine roots; many fine tubular pores and many very fine irregular pores; 20 percent gravel; slightly acid; clear smooth boundary.
AB—4 to 8 inches; brown (10YR 5/3) gravelly ashy sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine and fine roots; many fine tubular and irregular pores; 30 percent gravel; slightly acid; clear wavy boundary.
Bw—8 to 14 inches; pale brown (10YR 6/3) very gravelly ashy coarse sandy loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine and fine roots; common fine tubular and very fine irregular pores; 35 percent gravel; moderately acid; gradual wavy boundary.
BC—14 to 21 inches; pale brown (10YR 6/3) very gravelly coarse sandy loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular pores; 45 percent gravel and 5 percent cobbles; moderately acid; 5 percent fine mica flakes; gradual wavy boundary.
C—21 to 37 inches; pale yellow (2.5Y 7/3) extremely gravelly coarse sandy loam, light olive brown (2.5Y 5/4) moist; massive; slightly hard, friable, nonsticky and nonplastic; many very fine and fine roots; many very fine and fine irregular pores; 55 percent gravel and 10 percent cobbles; neutral; 10 percent fine mica flakes; abrupt irregular boundary.
R—37 inches; unweathered gneiss; fractured at 4- to 18-inch intervals with pockets of Cr material between cracks.

Typical Pedon Location

Map unit in which located: Brevco gravelly ashy sandy loam, 15 to 30 percent slopes
Location in survey area: Spokane County, Washington, about 4 miles southwest of Mount Spokane, Washington; about 575 feet west and 1,155 feet north of the southeast corner of section 2, T. 27 N., R. 44 E.

Range in Characteristics

Profile
Depth to bedrock—20 to 40 inches (lithic)
Thickness of volcanic ash influence—10 to 14 inches

A and AB horizons
Value—5 or 6 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—3 to 6 percent
Gravel content—15 to 30 percent
Reaction—slightly acid, neutral

Bw horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Texture—ashy coarse sandy loam, ashy sandy loam
Clay content—3 to 6 percent
Gravel content—35 to 45 percent
Cobble content—0 to 10 percent
Total rock fragment content—35 to 55 percent
Reaction—moderately acid, slightly acid

BC horizon
Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—2 to 4 dry or moist
Texture—coarse sandy loam, sandy loam
Clay content—2 to 6 percent
Gravel content—35 to 50 percent
Cobble content—0 to 10 percent
Total rock fragment content—35 to 60 percent
Reaction—moderately acid to neutral

C horizon
Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—2 to 4 dry or moist
Texture—loamy coarse sand, coarse sandy loam
Gravel content—30 to 60 percent
Cobble content—5 to 25 percent
Total rock fragment content—35 to 75 percent
Reaction—moderately acid to neutral

Brickel Taxadjunct

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Summits and shoulders of convex mountains and ridges
Parent material: Thick mantle of volcanic ash over gneiss or granite
Slope range: 15 to 30 percent
Elevation: 4,800 to 5,890 feet
Average annual precipitation: 40 to 50 inches
Average annual air temperature: 38 to 44 degrees F
Frost-free period: 30 to 60 days

Taxonomic class: Ashy-skeletal, amorphic Humic Vitricryands

Taxadjunct Features

The Brickel soils in this survey area have andic properties and an umbric epipedon. These differences, however, do not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 1 inch; slightly decomposed grasses and leaves.
A1—1 to 3 inches; black (10YR 2/1) gravelly ashy silt loam, dark grayish brown (10YR 4/2) dry; moderate fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine tubular and irregular pores; 20 percent gravel; moderately acid; gradual wavy boundary.
A2—3 to 9 inches; very dark brown (10YR 2/2) gravelly ashy silt loam, dark grayish brown (10YR 4/2) dry; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine roots; many very fine and fine tubular and irregular pores; 30 percent gravel; moderately acid; gradual wavy boundary.
Bw1—9 to 19 inches; very dark grayish brown (10YR 3/2) very gravelly ashy silt loam, grayish brown (10YR 5/2) dry; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine roots; many very fine and fine irregular and tubular pores; 35 percent gravel; moderately acid; gradual wavy boundary.
Bw2—19 to 27 inches; dark brown (10YR 3/3) very gravelly ashy silt loam, brown (10YR 5/3) dry; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; few very fine and fine roots; many very fine and fine tubular and irregular pores; 40 percent gravel and 5 percent cobbles; moderately acid; gradual wavy boundary.
Bw3—27 to 31 inches; dark yellowish brown (10YR 3/4) very cobbly ashy very fine sandy loam, yellowish brown (10YR 5/4) dry; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; few very fine roots; many very fine and fine tubular and irregular pores; 30 percent gravel and 25 percent cobbles; moderately acid; gradual wavy boundary.
2R—31 inches; weakly weathered gneiss; cannot be dug with spade.

Typical Pedon Location

Map unit in which located: Brickel gravelly ashy silt loam, 15 to 30 percent slopes
Location in survey area: Spokane County, Washington, at the summit of Ragged Ridge, Washington; about 2,015 feet west and 2,230 feet south of the northeast corner of section 1, T. 27 N., R. 45 E.

Range in Characteristics

Profile
Depth to bedrock—20 to 40 inches (lithic)
Thickness of umbric epipedon—15 to 30 inches
Thickness of volcanic ash mantle—20 to 35 inches
Reaction—moderately acid, slightly acid

A horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—3 to 8 percent
Gravel content—15 to 30 percent

Bw1 and Bw2 horizons
Value—4 or 5 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Clay content—3 to 8 percent
Gravel content—35 to 60 percent
Cobble content—0 to 5 percent
Total rock fragment content—35 to 60 percent

Bw3 horizon
Value—4 or 5 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy very fine sandy loam, very fine sandy loam
Clay content—4 to 10 percent
Gravel content—20 to 40 percent
Cobble content—20 to 40 percent
Total rock fragment content—40 to 60 percent

A C horizon is in some pedons.

Bridgeson Series

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Drainageways
Parent material: Alluvium derived from glaciolacustrine sediment with an influence of volcanic ash in the upper part
Slope range: 0 to 3 percent
Elevation: 1,900 to 2,240 feet
Average annual precipitation: 20 to 30 inches
Average annual air temperature: 43 to 46 degrees F
Frost-free period: 80 to 110 days

Taxonomic class: Fine-loamy, mixed, superactive, frigid Aquandic Endoaquolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 12 inches; gray (10YR 5/1) ashy silt loam, very dark gray (10YR 3/1) moist; weak fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; many fine roots; neutral; clear smooth boundary.
Bg1—12 to 20 inches; gray (10YR 6/1) silt loam, dark gray (10YR 4/1) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common fine roots; common very fine and fine pores; few fine distinct redoximorphic concentrations that are brown (7.5YR 4/4) moist; neutral; clear wavy boundary.
Bg2—20 to 31 inches; gray (10YR 6/1) clay loam, dark gray (10YR 4/1) moist; moderate fine and medium subangular blocky structure; hard, very firm, moderately sticky and moderately plastic; common fine roots; many very fine and few fine pores; few faint clay films in pores; common medium distinct redoximorphic concentrations that are brown (7.5YR 4/4) moist; neutral; abrupt smooth boundary.
Bg3—31 to 40 inches; gray (10YR 6/1) clay loam, dark gray (10YR 4/1) moist; moderate fine and medium subangular blocky structure; hard, very firm, moderately sticky and moderately plastic; common fine roots; many very fine and few fine pores; common medium distinct redoximorphic concentrations that are brown (7.5YR 4/4) moist; neutral; clear smooth boundary.

Bg4—40 to 60 inches; gray (10YR 6/1) clay loam, dark gray (10YR 4/1) moist; strong medium angular blocky structure; very hard, very firm, moderately sticky and moderately plastic; few roots; common very fine pores; common medium prominent redoximorphic depletions that are bluish gray (5B 5/1) moist; few black stains on peds; neutral.

Typical Pedon Location

Map unit in which located: Bridgeson ashy silt loam, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 3 miles northwest of Deer Park, Washington; about 2,300 feet north and 200 feet west of the southeast corner of section 21, T. 29 N., R. 42 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—7 to 20 inches
Depth to apparent water table—10 to 20 inches in February through May, more than 20 inches in June through January
Depth to redoximorphic features with chroma of 2 or less—10 to 20 inches
Reaction—neutral, slightly alkaline throughout

Ap horizon
Hue—10YR, 2.5Y
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 or 2 dry or moist
Clay content—18 to 27 percent

Bg1 and Bg2 horizons
Hue—10YR, 2.5Y, 10Y, 5GY
Value—6 or 7 dry, 4 or 5 moist
Chroma—1 or 2 dry or moist
Texture—clay loam, silt loam, loam
Clay content—18 to 27 percent
Gravel content—0 to 5 percent

Bg3 and Bg4 horizons
Hue—10YR, 2.5Y, 10Y, 5GY
Value—6 or 7 dry, 4 or 5 moist
Chroma—1 or 2 dry or moist
Texture—clay loam, loam, silty clay loam, silt loam
Clay content—18 to 30 percent
Gravel content—0 to 5 percent

Cg horizon (where present)
Chroma—1 to 3 dry or moist
Texture—stratified loamy sand, loamy fine sand, sandy loam, loam, or silty clay loam

Brincken Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Outwash terraces adjacent to loess hills
Parent material: Loess mixed with a minor amount of volcanic ash over sandy and gravelly glaciofluvial deposits over older loess
Slope range: 0 to 25 percent
Elevation: 1,800 to 2,600 feet

Average annual precipitation: 15 to 25 inches
Average annual air temperature: 45 to 52 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Loamy-skeletal, mixed, superactive, mesic Vitrandic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 7 inches; grayish brown (10YR 5/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure parting to moderate medium granular; slightly hard, very friable, moderately sticky and slightly plastic; many very fine and few fine roots throughout; few fine and common very fine irregular pores; 1 percent fine gravel; slightly alkaline; abrupt smooth boundary.

A—7 to 13 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; moderate coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and few fine roots; few fine and common very fine irregular pores; 2 percent fine gravel; slightly alkaline; abrupt smooth boundary.

AB—13 to 19 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots throughout; few fine and common very fine tubular pores; 2 percent fine gravel; slightly alkaline; abrupt smooth boundary.

Bw—19 to 29 inches; pale brown (10YR 6/3) ashy silt loam, dark brown (10YR 3/3) moist; weak medium and coarse subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine roots throughout; few to many fine and very fine dendritic tubular pores and common very fine irregular pores; 5 percent fine gravel; slightly alkaline; gradual smooth boundary.

Bt1—29 to 41 inches; pale brown (10YR 6/3) extremely gravelly loam, dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine roots throughout; many fine and medium interstitial pores; 80 percent distinct clay films on rock fragments and 10 percent distinct clay films on surfaces of root channels; 45 percent gravel and 15 percent cobbles; neutral; clear wavy boundary.

Bt2—41 to 57 inches; very pale brown (10YR 7/3) very gravelly sandy clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots throughout; many very fine and medium interstitial pores; 60 percent distinct clay bridges between sand grains, 20 percent faint clay films on surfaces of root channels, and 15 percent distinct clay bodies that are yellowish brown (10YR 5/4) moist and around rock fragments; 45 percent gravel and 10 percent cobbles; neutral; gradual wavy boundary.

2Btb—57 to 60 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 3/6) moist; moderate coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots throughout; few very fine and common fine and medium dendritic tubular pores; 23 percent clay films lining pores and root channels and 12 percent clay films on faces of peds; 5 percent fine gravel; neutral.

Typical Pedon Location

Map unit in which located: Brincken ashy silt loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 5 miles southeast of Reardan, Washington; about 1,790 feet east and 1,420 feet south of the northwest corner of section 21, T. 25 N., R. 40 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—19 to 30 inches
Depth to older loess—40 to 60 inches
Rock fragment content in particle-size control section—averages 35 to 70 percent

Ap horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—10 to 20 percent
Gravel content—0 to 5 percent
Reaction—slightly acid to slightly alkaline

A and AB horizons
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Texture—ashy silt loam, ashy very fine sandy loam, ashy loam
Clay content—10 to 20 percent
Gravel content—0 to 5 percent
Reaction—slightly acid to slightly alkaline

Bw horizon (where present)
Value—3 to 6 dry, 3 or 4 moist
Chroma—3 to 5 dry, 2 to 4 moist
Texture—ashy silt loam, ashy sandy loam, loam
Clay content—5 to 20 percent
Gravel content—0 to 30 percent
Reaction—slightly acid to slightly alkaline

Bt1 and Bt2 horizons
Hue—10YR, variegated in some pedons
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 to 6 dry or moist
Texture—silt loam, loam, or clay loam in upper part; silty clay loam, sandy loam, or sandy clay loam in lower part
Clay content—15 to 30 percent
Gravel content—35 to 70 percent
Cobble content—0 to 15 percent
Total rock fragment content—35 to 80 percent
Reaction—neutral to moderately alkaline

C horizon (above 2Btb horizon in some pedons)
Texture—sand, loamy sand

2Btb horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—4 to 6 dry or moist
Texture—silt loam, silty clay loam, silty clay
Clay content—18 to 45 percent
Gravel content—0 to 5 percent
Reaction—neutral to moderately alkaline

A 2Btkb or 2Bkqb horizon is in some pedons.

Broadax Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits, backslopes, and footslopes of loess hills
Parent material: Loess
Slope range: 0 to 30 percent
Elevation: 2,200 to 2,780 feet
Average annual precipitation: 15 to 20 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Calcic Argixerolls (fig. 22)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 7 inches; dark grayish brown (10YR 4/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine irregular pores and few coarse tubular pores; noneffervescent; moderately acid; abrupt smooth boundary.

A—7 to 15 inches; dark yellowish brown (10YR 4/4) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure parting to moderate fine granular; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine irregular pores and few coarse tubular pores; noneffervescent; neutral; abrupt wavy boundary.

Bt—15 to 28 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 3/4) moist; moderate fine prismatic structure parting to moderate medium subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine irregular pores; few distinct clay films on faces of peds; noneffervescent; strongly alkaline; abrupt wavy boundary.

Btk—28 to 33 inches; light gray (10YR 7/2) silt loam, brown (10YR 4/3) moist; moderate fine prismatic structure parting to moderate medium subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine irregular pores; few distinct clay films on faces of peds; few fine carbonate masses that are white (10YR 8/1) moist and along pores; violently effervescent; strongly alkaline; clear wavy boundary.

Bk—33 to 60 inches; light gray (10YR 7/2) silt loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots; common very fine irregular pores; common fine carbonate masses that are white (10YR 8/1) moist and along pores; violently effervescent; strongly alkaline.

Typical Pedon Location

Map unit in which located: Broadax silt loam, 8 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 8 miles west of Latah, Washington; about 2,640 feet south and 590 feet west of the northeast corner of section 26, T. 21 N., R. 43 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 20 inches
Depth to argillic horizon—10 to 20 inches

Figure 22.—Typical profile of a Broadax soil. Numerals on tape indicate centimeters.

Depth to secondary carbonates—25 to 44 inches
Clay content in particle-size control section—18 to 35 percent
Depth to durinodes—below 40 inches in some pedons

Ap and A horizons
Hue—2.5Y, 10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 dry, 2 or 3 moist
Clay content—15 to 25 percent
Reaction—moderately acid to slightly alkaline

Bt horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, silty clay loam

Clay content—18 to 35 percent
Reaction—neutral to strongly alkaline

Btk horizon
Value—5 to 7 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—18 to 35 percent
Reaction—slightly alkaline to strongly alkaline

Bk horizon
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Clay content—12 to 24 percent
Gravel content—0 to 10 percent
Reaction—slightly alkaline to strongly alkaline

Brodeer Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits and footslopes of hills
Parent material: Thick mantle of volcanic ash over residuum derived from quartz-monzonite and other granitic rock
Slope range: 3 to 15 percent
Elevation: 2,300 to 4,000 feet
Average annual precipitation: 30 to 40 inches
Average annual air temperature: 41 to 44 degrees F
Frost-free period: 60 to 90 days

Taxonomic class: Ashy over loamy, amorphic over mixed, superactive, frigid Alfic Udivitrands

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 1 inch; slightly decomposed plant material.
Oe—1 to 2 inches; moderately decomposed plant material.
A—2 to 4 inches; very dark brown (7.5YR 2.5/2) ashy silt loam, dark brown (7.5YR 3/2) dry; weak fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; many fine tubular pores and many very fine irregular pores; neutral; clear smooth boundary.
Bw1—4 to 8 inches; dark brown (7.5YR 3/3) ashy silt loam, brown (7.5YR 4/3) dry; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine, fine, and medium and few coarse roots; many fine irregular pores and common very fine tubular pores; neutral; clear wavy boundary.
Bw2—8 to 18 inches; dark brown (7.5YR 3/4) ashy silt loam, brown (7.5YR 5/4) dry; weak medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine, fine, and medium and few coarse roots; many fine irregular pores and common very fine and fine tubular pores; slightly acid; clear wavy boundary.
Bw3—18 to 26 inches; dark yellowish brown (10YR 4/4) ashy silt loam, light yellowish brown (10YR 6/4) dry; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine, fine, and medium roots; many fine irregular pores and common very fine and fine tubular pores; 10 percent continuous faint clay films along pores and 20 percent

discontinuous faint clay films on faces of peds; 5 percent fine gravel: moderately acid; abrupt wavy boundary.

2Bt1—26 to 32 inches; brown (10YR 4/3) fine gravelly sandy loam, pale brown (10YR 6/3) dry; moderate medium subangular blocky structure; hard, firm, slightly sticky and moderately plastic; few very fine and fine roots; few fine and common very fine tubular pores; 10 percent distinct clay films along pores and 20 percent faint clay films on faces of peds; 15 percent subangular fine gravel; strongly acid; clear wavy boundary.

2Bt2—32 to 47 inches; yellowish brown (10YR 5/4) fine gravelly loam, very pale brown (10YR 7/3) dry; moderate fine and medium subangular blocky structure; hard, firm, slightly sticky and moderately plastic; few very fine and fine roots; few very fine and fine tubular pores; 10 percent faint clay films on faces of peds; 15 percent fine gravel; strongly acid; 2 percent fine mica flakes; gradual wavy boundary.

2BC—47 to 61 inches; brown (10YR 5/3) fine gravelly sandy loam, very pale brown (10YR 7/3) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine and fine tubular pores; 5 percent faint clay films on faces of peds; 25 percent fine gravel; strongly acid; 2 percent fine mica flakes.

Typical Pedon Location

Map unit in which located: Brodeer ashy silt loam, 3 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 8.5 miles north of Moab Junction; about 2,375 feet south and 700 feet east of the northwest corner of section 1, T. 27 N., R. 45 E.

Range in Characteristics

Profile

Depth to bedrock—more than 60 inches (paralithic)
Thickness of volcanic ash mantle—14 to 24 inches

A horizon

Hue—10YR, 7.5YR
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 to 4 dry or moist
Clay content—4 to 8 percent
Reaction—slightly acid, neutral

Bw horizon

Hue—10YR, 7.5YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Clay content—4 to 8 percent
Fine gravel content—0 to 5 percent
Reaction—moderately acid to neutral

2Bt horizon

Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam
Clay content—18 to 24 percent
Gravel content—5 to 30 percent
Reaction—strongly acid to neutral

2BC horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam
Clay content—12 to 18 percent
Gravel content—5 to 30 gravel
Reaction—strongly acid to slightly acid

Cald Series

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Drainageways and treads of flood plains
Parent material: Alluvium derived from loess
Slope range: 0 to 2 percent
Elevation: 2,300 to 2,650 feet
Average annual precipitation: 18 to 23 inches
Average annual air temperature: 47 to 49 degrees F
Frost-free period: 100 to 135 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Typic Argiaquolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 7 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; weak fine subangular blocky structure parting to moderate very fine granular; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and fine and few medium tubular pores; slightly acid; clear smooth boundary.

Ap2—7 to 13 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure parting to moderate fine granular; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and fine and few medium tubular pores; few fine distinct masses of iron accumulation that are brown (7.5YR 4/4) dry and few distinct zones of iron depletion that are gray (10YR 5/1) dry; slightly acid; clear wavy boundary.

Ab—13 to 17 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; weak thick platy structure parting to moderate fine angular blocky; moderately hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine and few medium tubular pores; few distinct silt coatings that are white (10YR 8/1) dry and on ped surfaces and lining pores; few fine distinct masses of iron accumulation that are brown (7.5YR 4/4) dry; slightly acid; gradual irregular boundary.

Ab/Bgb—17 to 25 inches; 70 percent Ab material that is dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist, and 30 percent Bgb material that is grayish brown (10YR 5/2), stratified silt loam to very fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure parting to weak very fine angular blocky; moderately hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine and few medium tubular pores; common fine distinct masses of iron accumulation that are brown (7.5YR 4/4) dry and few distinct zones of iron depletion that are gray (10YR 5/1) dry; slightly acid; clear smooth boundary.

Bgb1—25 to 40 inches; gray (10YR 6/1) silt loam, very dark gray (10YR 3/1) moist; weak coarse subangular blocky structure parting to weak fine angular blocky;

moderately hard, friable, slightly sticky and slightly plastic; few very fine roots; many very fine and fine and few medium tubular pores; common distinct masses of iron accumulation that are strong brown (7.5YR 4/6) dry and few prominent iron-manganese masses; neutral; clear wavy boundary.

Bgb2—40 to 48 inches; gray (10YR 6/1) silt loam, very dark gray (10YR 3/1) moist; weak medium platy structure parting to moderate very fine angular blocky; moderately hard, friable, slightly sticky and slightly plastic; few fine roots; many very fine and fine and few medium tubular and irregular pores; reduced matrix; neutral; clear wavy boundary.

Btgb—48 to 60 inches; gray (10YR 5/1) silty clay loam, very dark gray (10YR 3/1) moist; moderate medium and coarse angular blocky structure; hard, firm, very sticky and very plastic; few very fine roots; common very fine and fine and few medium tubular and irregular pores; few distinct silt coatings that are white (10YR 8/1) dry and on surfaces of peds and lining pores; few prominent organoargillans that are black (10YR 2/1) dry and on faces of peds; common distinct zones of iron depletion and common distinct masses of iron accumulation that are brown (7.5YR 4/4) dry; slightly alkaline.

Typical Pedon Location

Map unit in which located: Thatuna-Cald complex, 0 to 8 percent slopes

Location in survey area: Benewah County, Idaho, about 6 miles northwest of Plummer, Idaho; about 850 feet south and 1,520 feet east of the northwest corner of section 6, T. 46 N., R. 5 W.

Range in Characteristics

Profile

Thickness of mollic epipedon—24 to 38 inches

Depth to apparent water table—11 to 13 inches in February through April, more than 13 inches in May through January

Depth to redoximorphic features—7 to 19 inches

Depth to argillic horizon—40 to 60 inches

Ap horizon, and Ab and Ab/Bgb horizons (where present)

Value—3 to 5 dry, 2 or 3 moist

Chroma—1 or 2 moist or dry

Clay content—15 to 25 percent in Ap and Ab horizons, 6 to 27 percent in Ab/Bgb horizon

Reaction—moderately acid to neutral

Bgb and Btgb horizons

Hue—10YR, 2.5Y

Value—4 to 6 dry, 3 to 5 moist

Chroma—1 to 3 moist or dry

Texture—silt loam, silty clay loam

Clay content—20 to 35 percent

Reaction—slightly acid to slightly alkaline

A Cg horizon is in some pedons.

Caldwell Series

Depth class: Very deep

Drainage class: Somewhat poorly drained

Position on landscape: Treads of drainageways and toeslopes of loess hills

Parent material: Alluvium derived from loess

Slope range: 0 to 3 percent
Elevation: 2,100 to 2,650 feet
Average annual precipitation: 17 to 23 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Cumulic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 4 inches; dark grayish brown (10YR 4/2) silt loam, very dark gray (10YR 3/1) moist; moderate medium granular structure; moderately hard, firm, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and few fine irregular pores; slightly acid; abrupt wavy boundary.

Ap2—4 to 10 inches; dark grayish brown (10YR 4/2) silt loam, very dark gray (10YR 3/1) moist; moderate coarse subangular blocky structure parting to thick platy; moderately hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; many very fine and few fine irregular pores; neutral; abrupt wavy boundary.

A1—10 to 16 inches; dark brown (10YR 3/3) silt loam, very dark gray (10YR 3/1) moist; strong very coarse prismatic structure parting to very thick platy; moderately hard, friable, slightly sticky and slightly plastic; common very fine roots; common fine irregular pores; neutral; clear wavy boundary.

A2—16 to 21 inches; very dark grayish brown (10YR 3/2) silt loam, very dark gray (10YR 3/1) moist; strong very coarse prismatic structure parting to very thick platy; moderately hard, friable, moderately sticky and slightly plastic; common very fine roots; many very fine and few fine irregular pores and few medium tubular pores; 1 percent prominent very dark gray (10YR 3/1) organic stains on faces of peds; few fine prominent iron masses that are yellowish red (5YR 5/6) moist; neutral; clear wavy boundary.

AB—21 to 30 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate very coarse prismatic structure parting to coarse subangular blocky; moderately hard, friable, moderately sticky and slightly plastic; few very fine roots; many very fine irregular pores and few medium tubular pores; few distinct clay films that are dark yellowish brown (10YR 4/4) moist and on faces of peds; few fine prominent iron masses that are yellowish red (5YR 5/6) moist; neutral; clear wavy boundary.

Bw—30 to 40 inches; pale brown (10YR 6/3) silt loam, light olive brown (2.5Y 5/3) moist; coarse subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine and few fine irregular pores and few medium tubular pores; few prominent organoargillans that are very dark gray (10YR 3/1) moist and along pores; few fine prominent hard iron-manganese nodules that are black (10YR 2/1) moist; few fine distinct iron masses that are yellowish red (5YR 5/6) moist; neutral; clear wavy boundary.

Bt1—40 to 52 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; medium angular blocky structure; moderately hard, friable, slightly sticky and moderately plastic; few very fine roots; common very fine and few fine irregular pores and few medium tubular pores; few distinct clay films that are dark yellowish brown (10YR 4/4) moist and on faces of peds and few distinct organoargillans that are very dark gray (10YR 3/1) moist and along pores; few fine prominent hard iron-manganese nodules that are black (10YR 2/1) moist; many very coarse prominent iron masses that are yellowish red (5YR 5/6) moist; neutral; clear wavy boundary.

Bt2—52 to 60 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; medium angular blocky structure; moderately hard, friable, slightly sticky and moderately plastic; few very fine roots; common very fine and few fine irregular pores and few medium tubular pores; few distinct clay films that are dark yellowish brown (10YR 4/4) moist and on faces of peds and few distinct organoargillans that are very dark gray (10YR 3/1) moist and along pores; few fine prominent hard iron-manganese nodules that are black (10YR 2/1) moist; many extremely coarse prominent iron masses that are yellowish red (5YR 5/6) moist; neutral.

Typical Pedon Location

Map unit in which located: Caldwell-Thatuna complex, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 3.5 miles south of Waverly, Washington; about 1,075 feet south and 2,034 feet west of the northeast corner of section 27, T. 21 N., R. 44 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—20 to 38 inches
Depth to apparent water table—16 to 21 inches in February through March, more than 16 inches in April through January
Depth to redoximorphic features—16 to 40 inches

A horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 moist or dry
Clay content—15 to 27 percent
Reaction—neutral, slightly acid

AB horizon (where present)
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 moist or dry
Clay content—18 to 27 percent
Reaction—neutral, slightly acid

Bw horizon
Hue—10YR to 2.5Y
Value—4 to 6 dry, 2 to 5 moist
Chroma—1 to 3 moist or dry
Clay content—18 to 27 percent

Bt horizon
Hue—2.5Y to 10YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—1 to 4 moist or dry
Texture—silt loam, silty clay loam
Clay content—18 to 35 percent

A BCg or Cg horizon is in some pedons.

Carlinton Series

Depth class: Moderately deep to a fragipan
Drainage class: Moderately well drained
Position on landscape: Backslopes and shoulders of loess plateaus

Parent material: Volcanic ash over loess
Slope range: 3 to 25 percent
Elevation: 2,560 to 3,230 feet
Average annual precipitation: 25 to 28 inches
Average annual air temperature: 43 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Fine-silty, mixed, superactive, frigid Vitrandic Fragixeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Ap1—0 to 5 inches; very dark grayish brown (10YR 3/2) ashy silt loam, brown (10YR 5/3) dry; weak fine and medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine and few medium roots; many very fine and fine and few medium tubular pores; strongly acid; gradual wavy boundary.

Ap2—5 to 10 inches; dark brown (10YR 3/3) ashy silt loam, pale brown (10YR 6/3) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and few medium roots; many very fine and fine and few medium tubular pores; strongly acid; clear wavy boundary.

Bw—10 to 14 inches; brown (10YR 4/3) silt loam, pale brown (10YR 6/3) dry; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and fine and few medium tubular pores; slightly acid; abrupt wavy boundary.

EBt—14 to 20 inches; E part is pale brown (10YR 6/3) silt loam, very pale brown (10YR 7/3) dry, and B part is brown (10YR 5/3) silt loam, pale brown (10YR 6/3) dry; weak coarse and very coarse prismatic structure; hard, firm, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and fine and few medium tubular pores; few faint clay films on faces of peds and in pores and few faint very pale brown (10YR 7/3 dry) silt coatings in root channels; slightly acid; clear wavy boundary.

E—20 to 23 inches; light yellowish brown (2.5Y 6/3) and light brownish gray (2.5Y 6/2) silt loam, light gray (10YR 7/2) and white (2.5Y 8/1) dry; weak medium and coarse prismatic structure; moderately hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; many very fine and fine and few medium tubular pores; few fine iron-manganese concretions; common fine prominent iron masses that are light yellowish brown (10YR 6/4) and yellowish brown (10YR 5/4) dry; slightly acid; abrupt wavy boundary.

BtxbE—23 to 30 inches; B part is brown (10YR 4/3) and yellowish brown (10YR 5/4) silt loam, yellowish brown (10YR 5/4) and light yellowish brown (10YR 6/4) dry, and E part is pale brown (10YR 6/3) and light gray (10YR 7/2) silt loam, pale brown (10YR 6/3) and pale yellow (2.5Y 8/2) dry; moderate coarse prismatic structure; extremely hard, extremely firm and brittle, slightly sticky and slightly plastic; few very fine and fine roots between peds; many very fine and fine and few medium tubular pores; many faint continuous clay films on faces of peds and in pores and common prominent pale yellow (2.5Y 8/2 dry) silt coatings on vertical and top faces of peds; few fine iron-manganese concretions; about 50 percent fragic material that is brittle when moist; slightly acid; clear wavy boundary.

Btxb1—30 to 42 inches; mixed dark yellowish brown (10YR 4/4) and brown (10YR 5/3) silty clay loam, pale brown (10YR 6/3) and light yellowish brown (10YR 6/4) dry; moderate coarse prismatic structure; extremely hard, extremely firm and brittle, moderately sticky and moderately plastic; many very fine and fine and few medium tubular pores; common distinct and prominent clay films that are brown (7.5YR

5/4) dry and on faces of peds and in pores and common prominent silt coatings that are light gray (2.5Y 7/2) dry and on vertical faces of peds; about 75 percent fragic material that is brittle when moist; slightly acid; gradual wavy boundary.

Btxb2—42 to 53 inches; yellowish brown (10YR 5/4) silty clay loam, light yellowish brown (10YR 6/4) and pale brown (10YR 6/3) dry; weak medium and coarse prismatic structure; extremely hard, extremely firm and brittle, moderately sticky and moderately plastic; common very fine and fine tubular pores and few medium irregular pores; common faint and few distinct and prominent continuous clay films that are brown (7.5YR 5/4) dry and on faces of peds and in pores and common prominent silt coatings that are light gray (2.5Y 7/2) dry and on vertical faces of peds; few very fine iron-manganese concretions; about 35 percent fragic material; neutral; gradual wavy boundary.

Btb—53 to 60 inches; yellowish brown (10YR 5/4) silty clay loam, light yellowish brown (10YR 6/4) dry; weak medium and coarse prismatic structure; extremely hard, extremely firm, moderately sticky and moderately plastic; common very fine and fine tubular pores and few medium irregular pores; few distinct and prominent clay films that are brown (7.5YR 5/4) dry and on faces of peds and in pores and common prominent silt coatings that are light gray (2.5Y 7/2) dry and on vertical faces of peds and in root channels; neutral.

Typical Pedon Location

Map unit in which located: Carlinton, dry-Taney complex, 3 to 8 percent slopes

Location in survey area: Benewah County, Idaho, about 2 miles northeast of the town of Plummer, Idaho; about 2,300 feet south and 850 feet west of the northeast corner of section 5, T. 46 N., R. 4 W.

Range in Characteristics

Profile

Depth to fragipan—26 to 40 inches

Depth to perched water table—14 to 20 inches in February, more than 14 inches in March through April

Depth to redoximorphic features—14 to 20 inches

Thickness of volcanic ash influence—7 to 12 inches

A horizon

Hue—10YR

Value—5 or 6 dry, 2 to 4 moist

Chroma—2 to 4 dry or moist

Clay content—10 to 18 percent

Reaction—strongly acid to slightly acid

Bw horizon

Hue—10YR

Value—5 or 6 dry, 3 or 4 moist

Chroma—3 or 4 dry or moist

Texture—silt loam, ashy silt loam

Clay content—11 to 20 percent

Reaction—moderately acid, slightly acid

EBt horizon

Hue—10YR

Value—6 or 7 dry, 4 to 6 moist

Chroma—2 to 4 dry or moist

Clay content—12 to 21 percent

Total rock fragment content—0 to 3 percent gravel
Reaction—moderately acid, slightly acid

E horizon
Hue—10YR, 2.5Y
Value—6 to 8 dry, 5 or 6 moist
Chroma—1 to 4 dry or moist
Clay content—9 to 15 percent
Total rock fragment content—0 to 3 percent gravel
Reaction—strongly acid to slightly acid

BtxbE horizon
Btbx part:
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
E part:
Hue—10YR, 2.5Y
Value—6 to 8 dry, 5 to 7 moist
Chroma—2 to 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—20 to 32 percent
Total rock fragment content—0 to 5 percent gravel
Reaction—moderately acid, slightly acid

Btxb horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, silt loam
Clay content—24 to 36 percent
Total rock fragment content—0 to 5 percent gravel
Reaction—moderately acid to neutral

Btb horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, silt loam
Clay content—24 to 34 percent
Reaction—moderately acid to neutral

Cassyhill Series

Depth class: Shallow
Drainage class: Well drained
Position on landscape: Backslopes and shoulders of mountains and hills
Parent material: Volcanic ash and loess over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 5 to 65 percent
Elevation: 2,190 to 4,840 feet
Average annual precipitation: 25 to 35 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 90 to 140 days

Taxonomic class: Loamy-skeletal, isotic, mesic Lithic Ultic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 1 inch; slightly decomposed leaves, needles, and twigs mixed with 1980's Mount St. Helens volcanic ash.

A1—1 to 7 inches; very dark grayish brown (10YR 3/2) very gravelly ashy silt loam, grayish brown (10YR 5/2) dry; moderate very fine and fine subangular blocky structure parting to moderate fine granular; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine and fine tubular pores; 40 percent gravel and 10 percent channers; neutral; clear smooth boundary.

A2—7 to 11 inches; dark brown (10YR 3/3) very gravelly ashy loam, brown (10YR 5/3) dry; moderate fine and medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; many very fine and fine and few very coarse roots; many very fine and fine tubular pores; 35 percent gravel, 5 percent paragravel, 10 percent channers, 5 percent cobbles, and 5 percent flagstones; slightly acid; clear smooth boundary.

C—11 to 14 inches; dark yellowish brown (10YR 4/4) extremely channery loam, pale brown (10YR 6/3) dry; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common fine and medium roots; many very fine and fine tubular pores; 25 percent gravel, 35 percent channers, 15 percent cobbles, and 10 percent flagstones; moderately acid; gradual wavy boundary.

R—14 to 17 inches; strongly cemented, highly fractured siltite; common fine and coarse roots between fractures that are approximately 4 to 8 inches apart.

Typical Pedon Location

Map unit in which located: Cassyhill very gravelly ashy silt loam, 35 to 65 percent slopes

Location in survey area: Benewah County, Idaho, about 1,000 feet south and 2,150 feet west of the northeast corner of section 9, T. 46 N., R. 2 W.

Range in Characteristics

Profile

Depth to bedrock—10 to 20 inches (lithic)
Thickness of mollic epipedon—7 to 11 inches
Thickness of volcanic ash influence—7 to 11 inches

A1 and A2 horizons

Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—5 to 15 percent
Gravel content—15 to 55 percent
Paragravel content—0 to 10 percent
Cobble content—0 to 25 percent
Channer content—5 to 20 percent
Flagstone content—0 to 10 percent
Total rock fragment content—25 to 55 percent in upper part, 30 to 60 in lower part
Reaction—moderately acid to neutral

AC horizon (where present)

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist

Texture—ashy silt loam, ashy loam
Clay content—5 to 15 percent
Gravel content—15 to 30 percent
Paragravel content—0 to 30 percent
Cobble content—15 to 50 percent
Paracobble content—0 to 30 percent
Channer content—15 to 50 percent
Parachanner content—0 to 30 percent
Flagstone content—0 to 10 percent
Total rock fragment content—45 to 80 percent
Reaction—moderately acid, slightly acid

C horizon
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam
Clay content—5 to 20 percent
Gravel content—20 to 45 percent
Paragravel content—5 to 45 percent
Cobble content—20 to 40 percent
Paracobble content—0 to 30 percent
Channer content—20 to 50 percent
Parachanner content—0 to 35 percent
Flagstone content—0 to 50 percent
Total rock fragment content—65 to 85 percent
Reaction—strongly acid to slightly acid

Cedonia Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers on relict glacial lake terraces and outwash plains
Parent material: Calcareous glaciolacustrine deposits with an influence of loess and volcanic ash in the upper part
Slope range: 0 to 25 percent
Elevation: 1,800 to 2,000 feet
Average annual precipitation: 18 to 22 inches
Average annual air temperature: 45 to 47 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 6 inches; light brownish gray (2.5Y 6/2) ashy silt loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few roots; common very fine and fine tubular and irregular pores; neutral; abrupt smooth boundary.
AB—6 to 12 inches; light brownish gray (2.5Y 6/2) ashy silt loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; slightly hard, friable,

slightly sticky and slightly plastic; few roots; many very fine tubular and irregular pores; neutral; clear smooth boundary.

Bk1—12 to 27 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; strong thin platy structure; slightly hard, friable, slightly sticky and slightly plastic; few roots; many very fine and fine tubular and irregular pores; few fine dark yellowish brown (10YR 3/4) coatings in thin bands; 10 percent fine carbonate threads throughout; strongly effervescent in some root channels; slightly alkaline; clear wavy boundary.

Bk2—27 to 33 inches; pale brown (10YR 6/3) silt loam, dark yellowish brown (10YR 4/4) moist; strong thin platy structure; hard, friable, slightly sticky and slightly plastic; few very fine roots; many fine irregular pores; few dark yellowish brown (10YR 3/4) coatings in thin bands; 10 percent fine carbonate threads throughout; strongly effervescent; moderately alkaline; clear smooth boundary.

C—33 to 60 inches; pale yellow (5Y 7/3) silt loam, olive (5Y 5/3) moist; finely laminated; slightly hard, friable, slightly sticky and slightly plastic; few roots along cleavage planes to a depth of about 50 inches; few fine irregular pores; strongly effervescent; strongly alkaline.

Typical Pedon Location

Map unit in which located: Cedonia ashy silt loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 0.2 mile east of the junction of Peone and Mount Spokane Roads, in a cultivated field about 30 feet north of Mount Spokane Road; in the southwest corner of section 33, T. 27 N., R. 44 E.

Range in Characteristics

Profile

Thickness of volcanic ash influence—7 to 14 inches
Depth to secondary carbonates—12 to 33 inches

A horizon

Hue—10YR, 2.5Y
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Reaction—slightly acid, neutral

Bk horizons

Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—2 to 4 dry or moist
Texture—silt loam, silt
Clay content—10 to 26 percent
Content of fine carbonate threads and faint carbonate coatings—10 to 30 percent
Reaction—slightly alkaline, moderately alkaline

C horizon

Hue—10YR, 2.5Y, 5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 or 3 dry or moist
Texture—silt loam, silty clay loam
Clay content—14 to 35 percent
Redoximorphic concentrations—none or few faint iron and manganese masses
Reaction—slightly alkaline to strongly alkaline

Cheney Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers on outwash plains of channeled scablands
Parent material: Loess mixed with a minor amount of volcanic ash over sandy and gravelly glaciofluvial deposits
Slope range: 0 to 15 percent
Elevation: 1,800 to 2,550 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Coarse-loamy over sandy or sandy-skeletal, mixed, superactive, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 10 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak fine and medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots; many very fine irregular pores; neutral; abrupt smooth boundary.

A—10 to 14 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak thick platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots; many very fine irregular pores; neutral; clear wavy boundary.

Bw—14 to 22 inches; yellowish brown (10YR 5/4) ashy silt loam, dark yellowish brown (10YR 3/4) moist; weak medium prismatic structure; slightly hard, very friable, slightly sticky and slightly plastic; common fine roots; many very fine and fine irregular pores; neutral; gradual wavy boundary.

Bt—22 to 28 inches; light yellowish brown (10YR 6/4) ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak coarse prismatic structure; hard, friable, slightly sticky and slightly plastic; common fine roots; many very fine and fine irregular pores; few faint discontinuous clay films on faces of peds; neutral; clear wavy boundary.

2C1—28 to 32 inches; pale brown (10YR 6/3) very gravelly sandy loam, dark brown (10YR 4/3) moist; massive; loose, nonsticky and nonplastic; few roots; many very fine and fine interstitial pores; 40 percent gravel; few faint carbonate coatings on underside of some gravel; slightly alkaline; gradual wavy boundary.

2C2—32 to 60 inches; variegated extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; 70 percent gravel and 10 percent cobbles, dominantly basalt fragments with few granite and quartzite fragments; few faint carbonate coatings on underside of some gravel and cobbles; moderately alkaline.

Typical Pedon Location

Map unit in which located: Cheney ashy silt loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 1 mile east and 4 miles north of the town of Deep Creek, Washington; about 2,100 feet north and 50 feet west of the southeast corner of section 36, T. 26 N., R. 40 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 17 inches
Thickness of volcanic ash influence—20 to 36 inches

Depth to sandy-skeletal material—20 to 36 inches
Rock fragment content in upper part of control section—0 to 30 percent
Rock fragment content in lower part of control section—35 to 85 percent

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—10 to 18 percent
Gravel content—0 to 20 percent
Total rock fragment content—0 to 20 percent
Reaction—slightly acid to slightly alkaline

Bw and Bt horizons
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy loam, ashy silt loam
Clay content—10 to 18 percent
Gravel content—0 to 25 percent
Cobble content—0 to 10 percent
Total rock fragment content—less than 30 percent
Reaction—neutral, slightly alkaline

A 2BC horizon is in some pedons.

2C1 horizon (where present)
Value—5 or 6 dry
Chroma—3 or 4 dry or moist
Texture—sandy loam, loamy sand
Clay content—4 to 10 percent
Gravel content—25 to 75 percent
Cobble content—0 to 25 percent
Total rock fragment content—35 to 85 percent
Reaction—slightly alkaline, moderately alkaline

2C2 horizon, and 2Bq horizon (where present)
Texture—coarse sand, loamy coarse sand, loamy sand
Gravel content—25 to 75 percent
Cobble content—0 to 35 percent
Stone content—0 to 15 percent
Boulder content—0 to 5 percent
Total rock fragment content—35 to 85 percent
Reaction—slightly alkaline, moderately alkaline

Clayton Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers on outwash terraces
Parent material: Sandy glaciofluvial deposits mixed with a minor amount of loess and volcanic ash in the upper part
Slope range: 0 to 25 percent
Elevation: 1,800 to 2,400 feet
Average annual precipitation: 17 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Coarse-loamy, isotic, mesic Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 5 inches; brown (10YR 5/3) ashy fine sandy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few fine and common very fine roots; few fine and common very fine tubular pores; 1 percent gravel; moderately acid; abrupt smooth boundary.

Ap2—5 to 8 inches; brown (10YR 5/3) ashy fine sandy loam, dark brown (10YR 3/3) moist; moderate coarse subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few fine and medium and common very fine roots; common very fine tubular pores; 1 percent gravel; moderately acid; abrupt wavy boundary.

E and Bt1—8 to 29 inches; 95 percent pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist (E part); moderate thick platy structure; slightly hard, very friable, nonsticky and nonplastic; 5 percent continuous lamellae that are brown (7.5YR 4/4) sandy loam, brown (10YR 4/3) moist (Bt part); massive; slightly hard, very friable, nonsticky and nonplastic; few fine and common very fine and medium roots; few fine and common very fine tubular pores; 1 percent gravel; slightly acid; abrupt wavy boundary.

E and Bt2—29 to 42 inches; 85 percent pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist (E part); massive; slightly hard, very friable, nonsticky and nonplastic; 15 percent continuous lamellae that are brown (7.5YR 5/4) sandy loam, brown (10YR 4/3) moist (Bt part); moderate very thick platy structure; moderately hard, friable, nonsticky and nonplastic; 25 percent continuous faint clay bridges between sand grains; few very fine, fine, medium, and coarse roots; common very fine tubular and interstitial pores; 2 percent gravel; slightly acid; abrupt wavy boundary.

E and Bt3—42 to 52 inches; 80 percent pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist (E part); massive; slightly hard, very friable, nonsticky and nonplastic; 20 percent continuous lamellae that are brown (7.5YR 5/4) sandy loam, brown (10YR 4/3) moist (Bt part); moderate very thick platy structure; moderately hard, friable, nonsticky and nonplastic; 15 percent continuous faint clay bridges between sand grains; few very fine, fine, and medium roots; common very fine interstitial and tubular pores; 10 percent gravel and 2 percent cobbles; neutral; abrupt wavy boundary.

C—52 to 62 inches; variegated loamy fine sand; single grain; soft, loose, nonsticky and nonplastic; few very fine and fine roots; common very fine interstitial pores; 1 percent gravel; neutral.

Typical Pedon Location

Map unit in which located: Clayton ashy fine sandy loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 7.5 miles southeast of Deer Park, Washington; about 425 feet west and 1,350 feet north of the southeast corner of section 7, T. 27 N., R. 43 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—5 to 9 inches

Thickness of volcanic ash influence—7 to 14 inches

Depth to loamy fine sand or loamy sand—at least 25 inches and commonly 30 inches or more from mineral soil surface

A horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Clay content—4 to 10 percent
Gravel content—0 to 10 percent
Reaction—moderately acid to neutral

E and Bt horizons
E part:
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—fine sandy loam or sandy loam in upper part, loamy fine sand or loamy sand in lower part
Clay content—2 to 6 percent
Gravel content—0 to 10 percent
Cobble content—0 to 5 percent
Total rock fragment content—0 to 15 percent
Reaction—moderately acid to neutral

B part:
Hue—7.5YR, 10YR
Value—4 or 5 dry
Chroma—3 or 4 moist
Texture—fine sandy loam, sandy loam
Clay content—4 to 12 percent
Combined thickness of lamellae—less than 6 inches
Reaction—moderately acid to neutral

C horizon
Hue—variegated, 10YR
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy fine sand, loamy sand, sand
Clay content—0 to 3 percent
Gravel content—0 to 15 percent
Cobble content—0 to 5 percent
Total rock fragment content—0 to 20 percent
Reaction—slightly acid, neutral

A Bw horizon is in some pedons.

Cocolalla Series

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Depressions, drainageways
Parent material: Alluvium derived from volcanic ash with an influence of loess in the upper part
Slope range: 0 to 3 percent
Elevation: 1,950 to 2,550 feet
Average annual precipitation: 15 to 20 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Ashy, glassy, mesic Aquandic Endoaquolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 11 inches; dark gray (10YR 4/1) ashy silt loam, black (10YR 2/1) moist; moderate medium subangular blocky structure; friable, slightly hard, nonsticky and moderately plastic; common very fine and fine roots throughout; common very fine irregular pores; moderately acid; abrupt smooth boundary.

A2—11 to 28 inches; gray (2.5Y 6/1) ashy silt loam, black (10YR 2/1) moist; moderate medium subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; common very fine and fine roots throughout; common very fine irregular pores; 4 percent fine masses of oxidized iron-manganese that are dark yellowish brown (10YR 3/4) moist; neutral; abrupt wavy boundary.

Cg1—28 to 37 inches; white (10YR 8/1) ashy silt loam, light brownish gray (10YR 6/2) moist; massive; very friable, soft, nonsticky and nonplastic; common very fine and fine roots throughout; common very fine irregular pores; neutral; clear wavy boundary.

Cg2—37 to 43 inches; white (2.5Y 8/1) ashy silt loam, dark grayish brown (2.5Y 4/2) moist; massive; very friable, soft, nonsticky and nonplastic; common very fine and fine roots throughout; common very fine irregular pores; 5 percent fine masses of oxidized iron-manganese that are light olive brown (2.5Y 5/6) moist; neutral; clear wavy boundary.

Ab—43 to 54 inches; light gray (10YR 7/1) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; common very fine and fine roots throughout; common very fine irregular pores; 5 percent medium masses of oxidized iron-manganese that are dark yellowish brown (10YR 3/6) moist; neutral; clear wavy boundary.

Cgb—54 to 60 inches; pale yellow (2.5Y 8/2) ashy silt loam, light brownish gray (2.5Y 6/2) moist; massive; friable, slightly hard, slightly sticky and slightly plastic; common very fine and fine roots throughout; common very fine irregular pores; 5 percent medium masses of oxidized iron-manganese that are light yellowish brown (2.5Y 6/4) moist and 5 percent medium iron depletions that are greenish gray (10G 6/1) moist; neutral.

Typical Pedon Location

Map unit in which located: Cocolalla ashy silt loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 7.5 miles west of Nine Mile Falls, Washington; about 1,450 feet north and 625 feet east of the southwest corner of section 1, T. 26 N., R. 40 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 20 inches

Volcanic glass content—more than 60 percent in particle-size control section

Depth to apparent water table—soil surface to a depth of 11 inches in January through April, more than 11 inches in May through December

Depth to redoximorphic features (where present)—10 to 20 inches

A horizon

Hue—2.5Y, 10YR

Value—3 to 6 dry, 2 or 3 moist

Chroma—1 or 2 dry or moist
Clay content—10 to 20 percent
Reaction—moderately acid to neutral

Cg horizon
Hue—2.5Y, 10YR, 5Y
Value—5 to 8 dry, 3 to 6 moist
Chroma—1 or 2 dry or moist
Texture—dominantly ashy silt, ashy silt loam, or ashy very fine sandy loam; silty clay loam or clay loam in lower part of some pedons in areas where buried horizons are not present
Clay content—1 to 5 percent
Gravel—0 to 10 percent
Reaction—neutral, slightly alkaline

Ab horizon (where present)
Hue—2.5Y, 10YR
Value—5 to 7 dry, 2 to 4 moist
Chroma—1 to 3 moist or dry
Texture—ashy silt, ashy silt loam, ashy very fine sandy loam
Clay content—4 to 18 percent
Gravel—0 to 10 percent
Reaction—neutral, slightly alkaline

Cgb horizon (where present)
Hue—2.5Y, 10YR
Value—6 to 8 dry, 4 to 6 moist
Chroma—1 or 2 dry or moist
Texture—ashy silt, ashy silt loam, ashy very fine sandy loam, silty clay loam
Clay content—4 to 30 percent
Gravel—0 to 10 percent
Reaction—neutral, slightly alkaline

Colburn Taxadjunct

Depth class: Very deep
Drainage class: Somewhat poorly drained
Position on landscape: Drainageways of glacial outwash terraces
Parent material: Mixed alluvium with an influence of loess and volcanic ash in the upper part
Slope range: 0 to 3 percent
Elevation: 1,860 to 2,400 feet
Average annual precipitation: 20 to 30 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Coarse-loamy, mixed, superactive, frigid Aquandic Haploxerepts

Taxadjunct Features

The Colburn soils in this survey area are a taxadjunct to the series because they do not meet the criteria for a contrasting particle-size class. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oe—0 to 1 inch; moderately decomposed organic material.

A—1 to 5 inches; light brownish gray (10YR 6/2) ashy loam, 15 percent very dark gray (10YR 3/1) and 85 percent dark grayish brown (10YR 4/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky and slightly plastic; common fine and coarse and few medium roots throughout; common very fine tubular and irregular pores; moderately acid; abrupt smooth boundary.

Bw1—5 to 12 inches; pale brown (10YR 6/3) ashy fine sandy loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; few fine and medium roots throughout; many fine and very fine tubular and irregular pores; slightly acid; clear smooth boundary.

Bw2—12 to 21 inches; very pale brown (10YR 8/2) ashy fine sandy loam, brown (10YR 5/3) moist; moderate thick platy structure; soft, very friable, nonsticky and slightly plastic; few fine roots throughout; common very fine tubular and irregular pores; 5 percent very fine faint irregular masses of oxidized iron that are light olive brown (2.5Y 5/4) moist and on faces of peds; neutral; abrupt smooth boundary.

Bw3—21 to 32 inches; light yellowish brown (2.5Y 6/3) sandy loam, olive brown (2.5Y 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine roots throughout; common fine irregular pores; 2 percent faint masses of manganese that are black (2.5Y 2.5/1) moist; 10 percent fine and medium masses of oxidized iron that are dark yellowish brown (10YR 4/4) moist; 15 percent iron depletions that are grayish brown (2.5Y 5/2) moist; 2 percent fine mica flakes; 1 percent gravel; neutral; gradual wavy boundary.

Cg1—32 to 43 inches; light gray (2.5Y 7/2) loamy coarse sand, grayish brown (2.5Y 5/2) moist; massive; loose, nonsticky and nonplastic; common fine roots throughout; common fine irregular pores; 2 percent faint masses of manganese that are black (2.5Y 2.5/1) moist; 10 percent fine and medium masses of oxidized iron that are dark yellowish brown (10YR 4/4) moist; 15 percent iron depletions that are grayish brown (2.5Y 5/2) moist; 2 percent fine mica flakes; 1 percent gravel; neutral; gradual wavy boundary.

Cg2—43 to 55 inches; light yellowish brown (2.5Y 6/3) extremely gravelly loamy coarse sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; common very fine and few fine and medium irregular and interstitial pores; 15 percent fine and medium mica flakes; 60 percent gravel; slightly alkaline; clear wavy boundary.

Cg3—55 to 63 inches; light olive brown (2.5Y 5/4) loamy coarse sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; common very fine and fine irregular and interstitial pores; 20 percent distinct masses of iron-manganese that are dark yellowish brown (10YR 4/6) moist and are throughout and 2 percent medium distinct masses of reduced iron that are very dark gray (10YR 3/1) moist and are throughout; 10 percent medium mica flakes; 2 percent fine gravel; slightly alkaline.

Typical Pedon Location

Map unit in which located: Colburn ashy loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 1 mile southeast of Elk, Washington; about 1,100 feet south and 200 feet east of the northwest corner of section 21, T. 29 N., R. 44 E.

Range in Characteristics

Profile
Volcanic ash influence—zone from 7 to 25 inches
Depth to sand or loamy sand—20 to 40 inches
Depth to apparent water table—20 to 40 inches in December through May, 40 to 60 inches or more in January through November
Depth to redoximorphic features (where present)—20 to 40 inches

A horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Texture—ashy loam, ashy fine sandy loam
Clay content—8 to 15 percent
Gravel content—0 to 5 percent
Reaction—moderately acid to neutral

Bw horizon
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture—ashy fine sandy loam, ashy very fine sandy loam, ashy sandy loam, sandy loam
Clay content—5 to 12 percent
Gravel content—0 to 10 percent
Reaction—slightly acid, neutral

Cg horizon
Hue—10YR, 2.5Y, variegated
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—coarse sand, loamy coarse sand, loamy sand, sand, sandy loam
Clay content—0 to 5 percent
Gravel content—0 to 60 percent
Cobble content—0 to 10 percent
Total rock fragment content—0 to 60 percent
Reaction—slightly acid to slightly alkaline

C horizon (where present)
Hue—10YR, 2.5Y, variegated
Value—6 or 7 dry, 4 to 5 moist
Chroma—3 or 4 dry or moist
Texture—coarse sand, loamy coarse sand, loamy sand, sand
Clay content—0 to 8 percent
Gravel content—0 to 30 percent
Reaction—slightly acid to slightly alkaline

Dearyton Series

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Footslopes, summits, and backslopes of hills
Parent material: Loess with an influence of volcanic ash over colluvium and residuum derived from saprolitic gneiss, quartzite, Latah Formation, and till
Slope range: 0 to 30 percent
Elevation: 1,900 to 3,000 feet

Average annual precipitation: 18 to 25 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine, isotic, mesic Vitrandic Palexeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, twigs, and leaves.
A—1 to 6 inches; brown (10YR 5/3) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular and irregular pores; slightly acid; clear wavy boundary.
BE—6 to 12 inches; pale brown (10YR 6/3) ashy silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular and irregular pores; 10 percent skeletans on vertical faces of peds; 2 percent fine iron-manganese concretions; slightly acid; abrupt wavy boundary.
2Bt1—12 to 18 inches; brown (7.5YR 4/4) clay loam, brown (7.5YR 4/4) moist; strong coarse prismatic structure; extremely hard, extremely firm, very sticky and very plastic; few very fine and fine roots; few very fine irregular pores; 100 percent prominent clay films on vertical faces of peds; 2 percent fine iron-manganese concretions; 2 percent gravel; strongly acid; gradual wavy boundary.
2Bt2—18 to 28 inches; strong brown (7.5YR 4/6) clay loam, strong brown (7.5YR 4/6) moist; strong medium and coarse prismatic structure; extremely hard, extremely firm, very sticky and very plastic; few very fine roots; many very fine irregular pores; 100 percent prominent clay films on vertical faces of peds; 2 percent fine iron-manganese concretions; 2 percent gravel; slightly acid; abrupt wavy boundary.
2Bt3—28 to 38 inches; strong brown (7.5YR 4/6) clay loam, brown (7.5YR 4/4) moist; strong medium and coarse prismatic structure; very hard, very firm, very sticky and very plastic; few very fine roots; few very fine and fine irregular pores; 30 percent distinct and 70 percent prominent clay films on vertical faces of peds; 2 percent fine mica flakes; 5 percent gravel; neutral; clear wavy boundary.
2Bt4—38 to 55 inches; brown (7.5YR 5/4) clay loam, brown (7.5YR 4/4) moist; moderate medium and coarse subangular blocky structure; very hard, very firm, moderately sticky and moderately plastic; few very fine roots; few very fine irregular pores; 5 percent organoargillans and 20 percent clay films on vertical faces of peds; 2 percent fine mica flakes; 5 percent gravel; neutral; clear wavy boundary.
2Bt5—55 to 60 inches; strong brown (7.5YR 5/6) gravelly clay loam, strong brown (7.5YR 5/6) moist; moderate coarse subangular blocky structure; very hard, very firm, moderately sticky and moderately plastic; few very fine roots throughout; common very fine irregular pores; 20 percent distinct clay films on vertical faces of peds; 10 percent fine mica flakes; 5 percent paragravel and 25 percent gravel; slightly alkaline.

Typical Pedon Location

Map unit in which located: Dearyton ashy silt loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 0.5 mile east of Mica, Washington; about 1,950 feet north and 2,355 feet east of the southwest corner of section 23, T. 24 N., R. 44 E.

Range in Characteristics

Profile
Thickness of volcanic ash influence—7 to 14 inches
Depth to perched water table—6 to 12 inches in January through April
Depth to redoximorphic features—6 to 15 inches
Depth to argillic horizon—8 to 15 inches

O horizon
Absent in some pedons

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Reaction—slightly acid, neutral

BE horizon
Value—6 to 8 dry, 3 to 5 moist
Chroma—1 to 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—12 to 20 percent
Gravel content—0 to 5 percent fine gravel
Reaction—slightly acid, neutral

E horizon (where present)
Hue—10YR
Value—6 or 7 dry, 5 or 6 moist
Chroma—3 dry or moist
Texture—ashy silt loam, ashy loam
Gravel content—0 to 5 percent fine gravel
Reaction—moderately acid to neutral

2Bt horizon
Hue—10YR, 7.5YR, 5YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 to 6 dry or moist
Texture—silty clay, clay, clay loam, silty clay loam; gravelly or cobbly in some pedons
Clay content—35 to 50 percent in upper part, 32 to 45 percent in lower part
Gravel content—0 to 20 percent in upper part, 0 to 25 percent in lower part
Paragravel content—0 to 10 percent
Cobble content—0 to 20 percent
Total rock fragment content—0 to 20 percent in upper part, 0 to 30 percent in lower part
Reaction—moderately acid to neutral in upper part, slightly acid to slightly alkaline in lower part

Deno Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Patterned ground mounds on basalt plateaus of channeled scablands
Parent material: Loess mixed with a minor amount of volcanic ash over residuum derived from basalt or glaciofluvial deposits
Slope range: 0 to 15 percent

Elevation: 1,820 to 2,500 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Coarse-loamy, mixed, superactive, mesic Vitrandic Haploxerolls (fig. 23)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 4 inches; grayish brown (10YR 5/2) ashy silt loam, very dark brown (10YR 2/2) moist; moderate coarse granular structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and few fine roots; common very fine tubular and irregular pores; 2 percent gravel; neutral; clear smooth boundary.
A2—4 to 14 inches; grayish brown (10YR 5/2) ashy loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and few fine roots; common very fine tubular pores; 5 percent gravel; neutral; clear smooth boundary.
A3—14 to 28 inches; grayish brown (10YR 5/2) ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; common very fine tubular pores; 3 percent gravel; slightly effervescent; moderately alkaline; abrupt smooth boundary.
Bw1—28 to 40 inches; yellowish brown (10YR 5/4) loam, dark brown (10YR 3/3) moist; moderate coarse subangular blocky structure; slightly hard, very friable, nonsticky and slightly plastic; common very fine and few fine roots; common very fine and few fine tubular pores and few very fine irregular pores; 3 percent gravel; slightly effervescent; moderately alkaline; clear smooth boundary.
Bw2—40 to 48 inches; light yellowish brown (10YR 6/4) coarse sandy loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine and few medium roots; common very fine and few fine tubular pores and few very fine irregular pores; 4 percent gravel; slightly effervescent; slightly alkaline; abrupt wavy boundary.
2R—48 inches; unweathered basalt.

Typical Pedon Location

Map unit in which located: Rockly-Deno complex, 0 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 1 mile southwest of Airway Heights, Washington; about 2,300 feet south and 700 feet east of the northwest corner of section 27, T. 25 N., R. 41 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—20 to 30 inches
Thickness of volcanic ash influence—20 to 30 inches
Depth to bedrock—40 to 60 inches (lithic)
Clay content in particle-size control section—4 to 18 percent

A1 horizon
Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—10 to 18 percent
Gravel content—0 to 5 percent
Reaction—slightly acid, neutral

Figure 23.—Typical profile of a Deno soil. Numerals on tape indicate inches.

A2 and A3 horizon
Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—10 to 18 percent
Gravel content—0 to 20 percent
Reaction—slightly acid to moderately alkaline

A AB or BA horizon is in some pedons.

Bw horizon
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry, 2 to 4 moist
Texture—silt loam, loam, sandy loam, coarse sandy loam

Clay content—4 to 18 percent
Gravel content—0 to 20 percent
Reaction—slightly alkaline, moderately alkaline

BC or C horizon (where present)
Kind of material—glacial flood deposits

Driscoll Taxadjunct

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Summits, shoulders, and backslopes on loess hills of basalt plateaus
Parent material: Younger loess over older loess
Slope range: 0 to 25 percent
Elevation: 2,380 to 3,100 feet
Mean annual precipitation: 20 to 28 inches
Mean annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine, mixed, superactive, mesic Aquic Palexerolls (fig. 24)

Taxadjunct Features

The Driscoll soils in this survey area are a taxadjunct to the series because the perched water table meets the criteria for the aquic subgroup. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 5 inches; grayish brown (10YR 5/2) silt loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure parting to weak very fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and few medium roots; many very fine and fine tubular pores; moderately acid; clear smooth boundary.

Ap2—5 to 10 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine tubular pores; moderately acid; gradual wavy boundary.

AB—10 to 17 inches; grayish brown (10YR 5/2) and brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) and dark brown (10YR 3/3) moist; moderate medium subangular blocky structure parting to weak fine granular; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many very fine and fine and few medium tubular pores; slightly acid; clear irregular boundary.

EBtc—17 to 24 inches; pale brown (10YR 6/3) and brown (10YR 5/3) silt loam, brown (10YR 4/3) and dark grayish brown (10YR 4/2) moist; moderate medium and coarse subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; common very fine roots; many very fine and fine and few medium and coarse tubular pores; 5 percent discontinuous distinct clay films along pores; 15 percent continuous distinct silt coatings on faces of peds; 10 percent continuous distinct sand coatings on faces of peds; 5 percent fine distinct weakly cemented iron-manganese concretions in matrix; slightly acid; clear smooth boundary.

Ec—24 to 26 inches; light gray (2.5Y 7/2) silt loam, light yellowish brown (2.5Y 6/3) moist; weak fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine roots; common very fine tubular pores; 15 percent fine distinct weakly cemented iron-manganese concretions in matrix; slightly acid; abrupt smooth boundary.

Btb1—26 to 42 inches; yellowish brown (10YR 5/6 and 5/4) silty clay, dark brown (7.5YR 3/4) and brown (7.5YR 4/4) moist; strong coarse prismatic structure; extremely hard, extremely firm, very sticky and very plastic; common very fine roots; many very fine and fine tubular pores; 35 percent continuous prominent clay films that are brown (7.5YR 4/2) moist and on faces of peds; 10 percent fine distinct weakly cemented iron-manganese concretions in matrix; neutral; clear wavy boundary.

Figure 24.—Typical profile of a Driscoll soil.

Btb2—42 to 49 inches; light yellowish brown (10YR 6/4) and yellowish brown (10YR 5/4) silty clay, brown (10YR 4/3) and dark yellowish brown (10YR 4/4) moist; moderate coarse prismatic structure; moderately hard, firm, moderately sticky and moderately plastic; common very fine roots; common very fine and fine tubular pores; 10 percent discontinuous prominent organoargillans on vertical faces of peds, 30 percent continuous prominent clay films on faces of peds, and 30 percent distinct clay films along pores; 15 percent fine distinct weakly cemented iron-manganese concretions in matrix; neutral; gradual wavy boundary.

Btb3—49 to 61 inches; light yellowish brown (10YR 6/4) and very pale brown (10YR 7/3) silty clay loam, dark yellowish brown (10YR 3/4) and brown (10YR 4/3) moist; moderate medium prismatic structure; moderately hard, firm, slightly sticky and slightly plastic; common very fine roots; common very fine and fine tubular pores; 25 percent continuous prominent clay films on faces of peds and 30 percent distinct clay films along pores; 15 percent fine distinct weakly cemented iron-manganese concretions in matrix; 2 percent subrounded gravel; slightly alkaline.

Typical Pedon Location

Map unit in which located: Southwick-Driscoll complex, 3 to 15 percent slopes

Location in survey area: Benewah County, Idaho, about 4 miles northwest of the town of Plummer, Idaho, and 1.5 miles south of the county line; about 2,270 feet south and 695 feet east of the northwest corner of section 9, T. 46 N., R. 5 W.

Range in Characteristics

Profile

Depth to perched water table—21 to 28 inches in January through April
Depth to redoximorphic features—17 to 26 inches
Depth to abrupt textural change—25 to 35 inches

Ap horizon

Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—15 to 25 percent
Reaction—moderately acid, slightly acid

AB horizon

Hue—10YR
Value—4 or 5 dry, 2 to 4 moist
Chroma—2 to 3 dry or moist
Texture—silt loam
Clay content—17 to 25 percent
Reaction—moderately acid, slightly acid

EBtc horizon (where present)

Hue—10YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Texture—silt loam
Clay content—15 to 25 percent
Reaction—slightly acid, neutral

Ec horizon

Hue—10YR, 2.5Y
Value—5 to 7 dry, 4 to 6 moist
Chroma—2 to 4 dry, 3 or 4 moist

Texture—silt loam
Clay content—10 to 23 percent
Reaction—moderately acid to neutral

Btb1 and Btb2 horizons
Hue—7.5YR, 10YR
Value—4 to 6 dry, 3 to 5 moist
Chroma—3 to 6 dry or moist
Texture—silty clay, silty clay loam
Clay content—32 to 48 percent
Gravel content—0 to 5 percent
Reaction—moderately acid to neutral

Btb3 horizon
Hue—7.5YR, 10YR
Value—4 to 7 dry, 3 to 5 moist
Chroma—3 to 6 dry, 3 or 4 moist
Texture—silty clay loam, silty clay
Clay content—28 to 40 percent
Gravel content—0 to 5 percent
Reaction—neutral, slightly alkaline

Elmira Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Undulating to hilly dunes on outwash terraces
Parent material: Sandy glaciofluvial deposits
Slope range: 3 to 60 percent
Elevation: 1,900 to 2,240 feet
Average annual precipitation: 22 to 28 inches
Average annual air temperature: 42 to 49 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Mixed, frigid Lamellic Xeropsamments

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles and twigs.
A—1 to 6 inches; brown (10YR 5/3) loamy sand, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many fine and common medium and coarse roots; many fine interstitial pores; slightly acid; clear wavy boundary.
Bw—6 to 12 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine, medium, and coarse roots; many fine interstitial pores; slightly acid; clear wavy boundary.
E—12 to 23 inches; pale yellow (2.5Y 7/3) sand, light olive brown (2.5Y 5/3) moist; single grain; loose, nonsticky and nonplastic; few fine, medium, and coarse roots; many fine interstitial pores; slightly acid; gradual wavy boundary.
E and Bt1—23 to 54 inches; light yellowish brown (2.5Y 6/3) sand, olive brown (2.5Y 4/3) moist (E part); single grain; loose, nonsticky and nonplastic; seven $^{1}/_{2}$-inch-thick continuous faint wavy bands of lamellae that are light yellowish brown (10YR 6/4), dark yellowish brown (10YR 4/4) moist (Bt part); few fine and

medium roots; many fine interstitial pores; slightly acid; clear wavy boundary.

E and Bt2—54 to 66 inches; light yellowish brown (2.5Y 6/3) sand, olive brown (2.5Y 4/3) moist (E part); single grain; loose, nonsticky and nonplastic; five 1/4-inch-thick continuous faint wavy bands of lamellae that are light yellowish brown (10YR 6/4) (Bt part), dark yellowish brown (10YR 4/4) moist; few fine roots; many fine interstitial pores; slightly acid; clear wavy boundary.

E and Bt3—66 to 80 inches; light yellowish brown (2.5Y 6/3) sand, olive brown (2.5Y 4/3) moist (E part); single grain; loose, nonsticky and nonplastic; eleven 1/8-inch-thick continuous faint wavy bands of lamellae that are pale brown (10YR 6/3) (Bt part), brown (10YR 4/3) moist; many fine interstitial pores; slightly acid.

Typical Pedon Location

Map unit in which located: Elmira loamy sand, 3 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 4 miles southeast of Deer Park, Washington; about 1,430 feet west and 95 feet north of the southeast corner of section 19, T. 28 N., R. 43 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—4 to 8 inches
Clay content—0 to 5 percent throughout
Gravel content—0 to 5 percent
Reaction—slightly acid, neutral

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist

Bw horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist

E horizon

Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy sand, sand

E and Bt horizon

E part:
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Gravel content—0 to 5 percent
B part:
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy sand, sand
Combined thickness of lamellae—less than 6 inches
Gravel content—0 to 5 percent

C horizon (where present)

Texture—sand

Eloika Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Outwash plains
Parent material: Thick mantle of volcanic ash mixed with loess over outwash
Slope range: 0 to 8 percent
Elevation: 1,800 to 2,600 feet
Mean annual precipitation: 20 to 30 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Ashy over loamy, glassy over isotic, frigid Typic Vitrixerands

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material.
A—1 to 6 inches; brown (10YR 5/3) ashy very fine sandy loam, dark brown (10YR 3/3) moist; strong fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and common medium roots; common very fine tubular pores; 2 percent subrounded gravel; neutral; abrupt wavy boundary.
Bw1—6 to 14 inches; yellowish brown (10YR 5/4) ashy very fine sandy loam, dark yellowish brown (10YR 3/4) moist; moderate medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and many fine, medium, and coarse roots; few very fine tubular pores; 2 percent subrounded gravel; neutral; clear wavy boundary.
Bw2—14 to 21 inches; light yellowish brown (10YR 6/4) ashy very fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine, many medium, and few coarse roots; common very fine tubular pores; 2 percent subrounded gravel; neutral; clear wavy boundary.
2Bw3—21 to 41 inches; brown (10YR 6/4) sandy loam, yellowish brown (10YR 5/4) moist; weak coarse subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and medium roots; common very fine tubular pores and many fine interstitial pores; 5 percent subrounded gravel; slightly acid; abrupt wavy boundary.
3Bq—41 to 60 inches; variegated very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; many fine and medium irregular pores; 20 percent silica on bottom surfaces of rock fragments; 55 percent subrounded gravel; 2 percent cobbles; slightly acid.

Typical Pedon Location

Map unit in which located: Eloika ashy very fine sandy loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 4 miles northwest of Deer Park, Washington; about 1,300 feet south and 1,900 feet west of the northeast corner of section 20, T. 29 N., R. 43 E.

Range in Characteristics

Profile
Depth to sandy-skeletal material—25 to 40 inches
Thickness of volcanic ash mantle—14 to 20 inches
Reaction—slightly acid, neutral

A horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy very fine sandy loam
Clay content—3 to 9 percent
Gravel content—0 to 10 percent

Bw horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy silt loam, ashy very fine sandy loam, ashy loam, ashy sandy loam
Clay content—3 to 9 percent
Gravel content—0 to 15 percent

2Bw horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam
Clay content—5 to 10 percent
Gravel content—0 to 20 percent

3Bq horizon, and C horizon (where present, in pedons that do not contain silica)
Texture—loamy coarse sand, coarse sand, sand
Clay content—1 to 5 percent
Gravel content—35 to 55 percent
Cobble content—0 to 5 percent
Total rock fragment content—35 to 60 percent

Emdent Series

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Depressions, drainageways, flood plains
Parent material: Alluvium derived from volcanic ash mixed with loess in the upper part
Slope range: 0 to 3 percent
Elevation: 2,110 to 2,420 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 47 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Ashy, glassy, calcareous, mesic Aquandic Endoaquolls

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Aknzp—0 to 6 inches; very dark brown (10YR 2/2) ashy silt loam, gray (10YR 5/1) dry; weak medium subangular blocky structure parting to moderate fine granular; friable, slightly hard, slightly sticky and slightly plastic; common fine and medium roots throughout; common very fine and fine tubular pores; strongly effervescent; strongly alkaline; clear smooth boundary.

ABknz—6 to 9 inches; very dark grayish brown (10YR 3/2) ashy silt loam, gray (10YR 5/1) dry; moderate thick platy structure; friable, slightly hard, slightly sticky and slightly plastic; common very fine and fine roots throughout; common very fine and fine tubular pores; strongly effervescent; strongly alkaline; clear smooth boundary.

Bknz—9 to 13 inches; dark brown (10YR 3/3) ashy silt loam, grayish brown (10YR 5/2) dry; weak medium subangular blocky structure; friable, slightly hard, slightly

sticky and slightly plastic; common fine roots throughout; common very fine and fine tubular pores; 2 percent fine distinct masses of iron-manganese accumulation throughout; slightly effervescent; strongly alkaline; clear smooth boundary.

C1—13 to 21 inches; brown (10YR 5/3) ashy silt loam, light brownish gray (10YR 6/2) dry; massive; friable, slightly hard, slightly sticky and slightly plastic; common fine roots throughout; common very fine tubular pores; 5 percent fine masses of iron-manganese accumulation along root channels; noneffervescent; strongly alkaline; clear smooth boundary.

C2—21 to 28 inches; pale brown (10YR 6/3) ashy silt loam, light gray (10YR 7/2) dry; massive; friable, slightly hard, slightly sticky and slightly plastic; common fine roots throughout; common fine tubular pores; 2 percent fine distinct iron-manganese concretions throughout and 7 percent fine distinct masses of iron-manganese accumulation throughout; noneffervescent; strongly alkaline; clear smooth boundary.

C3—28 to 60 inches; pale brown (10YR 6/3) ashy silt, white (10YR 8/1) dry; massive; friable, slightly hard, slightly sticky and slightly plastic; common fine roots throughout; common very fine tubular pores; 10 percent medium faint masses of iron-manganese accumulation that are yellowish brown (10YR 5/6) moist and are throughout; noneffervescent; strongly alkaline.

Typical Pedon Location

Map unit in which located: Emdent ashy silt loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 1,780 feet north and 270 feet west of the southeast corner of section 30, T. 23 N., R. 41 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 20 inches

Zone of secondary calcium carbonate accumulation—0 to 20 inches

Zone of exchangeable sodium accumulation—0 to 20 inches

Depth to apparent water table—soil surface to a depth of 6 inches in January through April, more than 6 inches in May through December

Depth to redoximorphic features—10 to 20 inches

Aknzp horizon

Value—4 or 5 dry, 2 or 3 moist

Chroma—1 to 3 dry or moist

Effervescence—strongly effervescent, violently effervescent

Reaction—strongly alkaline

Bknz horizon

Value—5 to 7 dry

Chroma—1 to 3 dry or moist

Texture—ashy loam, ashy silt loam

Effervescence—slightly effervescent to violently effervescent

Reaction—moderately alkaline, strongly alkaline

C horizon

Value—6 to 8 dry, 5 to 7 moist

Chroma—1 or 2 dry, 2 or 3 moist

Texture—ashy very fine sandy loam, ashy silt, ashy silt loam

Gravel content—0 to 5 percent

Effervescence—noneffervescent, slightly effervescent

Reaction—moderately alkaline, strongly alkaline

Endoaquolls

Depth class: Deep, very deep
Drainage class: Poorly drained
Position on landscape: Flood plains, drainageways, stream terraces, seeps
Parent material: Alluvium derived from mixed sources
Slope range: Dominantly 0 to 3 percent, but more than 3 percent in areas of seeps
Elevation: 1,540 to 2,900 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Endoaquolls

Representative Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Ap—0 to 5 inches; very dark brown (10YR 2/2) loam, dark grayish brown (10YR 4/2) dry; strong medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and few medium roots; many fine irregular pores and many medium tubular pores; neutral; abrupt smooth boundary.

A—5 to 11 inches; very dark grayish brown (10YR 3/2) loam, grayish brown (10YR 5/2) dry; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; many fine irregular pores and many medium tubular pores; 2 percent medium strong brown (7.5YR 5/6) masses of oxidized iron on faces of peds; neutral; clear smooth boundary.

Bg1—11 to 19 inches; dark grayish brown (10YR 4/2) sandy loam, light brownish gray (10YR 6/2) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common fine irregular pores; 5 percent medium strong brown (7.5YR 5/6) masses of oxidized iron on faces of peds; neutral; clear smooth boundary.

Bg2—19 to 28 inches; dark grayish brown (10YR 4/2) fine sandy loam, light brownish gray (10YR 6/2) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common fine irregular pores; 10 percent medium strong brown (7.5YR 5/6) masses of oxidized iron on faces of peds; neutral; clear smooth boundary.

Cg—28 to 45 inches; dark grayish brown (10YR 4/2) fine sandy loam, light brownish gray (10YR 6/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common fine irregular pores; 20 percent medium strong brown (7.5YR 5/6) masses of oxidized iron on faces of peds; neutral; clear smooth boundary.

C—45 to 60 inches; olive brown (2.5Y 4/3), stratified sandy loam to fine sandy loam, light yellowish brown (2.5Y 6/3) dry; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; common fine irregular pores; 25 percent coarse strong brown (7.5YR 5/6) masses of oxidized iron on faces of peds; neutral.

Representative Pedon Location

Map unit in which located: Endoaquolls and Fluvaquents, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 7 miles north of Nine Mile Falls, Washington; about 100 feet north and 700 feet east of the southwest corner of section 4, T. 27 N., R. 42 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 20 inches
Depth to apparent water table—soil surface to a depth of 5 inches in January through April, more than 5 inches in May through December
Depth to redoximorphic features—5 to 10 inches
Depth to bedrock (where present)—40 to 60 inches (paralithic)
Reaction—slightly acid or neutral throughout

A horizon
Value—2 or 3 moist, 4 or 5 dry
Chroma—1 to 3 dry or moist
Texture—silt loam, loam, fine sandy loam
Clay content—5 to 25 percent
Gravel content—0 to 10 percent

Bg horizon
Value—2 to 4 moist, 4 to 6 dry
Chroma—1 or 2 dry or moist
Texture—fine sandy loam, sandy loam, loam, silt loam, silty clay loam
Clay content—5 to 30 percent
Gravel content—0 to 20 percent

Cg horizon
Value—2 to 4 moist, 4 to 6 dry
Chroma—1 or 2 dry or moist
Texture—loam, fine sandy loam, sandy loam, coarse sandy loam
Clay content—0 to 18 percent
Gravel content—0 to 45 percent
Cobble content—0 to 5 percent
Total rock fragment content—0 to 50 percent

C horizon
Value—2 to 4 moist, 4 to 6 dry
Chroma—2 or 3 dry or moist
Texture—stratified fine sandy loam to sandy loam, coarse sandy loam, loamy sand
Clay content—0 to 10 percent
Gravel content—0 to 55 percent
Cobble content—0 to 15 percent
Total rock fragment content—0 to 55 percent

A 2Cr horizon is in some pedons.

Some pedons have layers of sapric material, hemic material, diatoms, or volcanic ash or have weathered granite.

Fan Lake Series

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Relict glacial lake terraces, outwash plains
Parent material: Thin mantle of volcanic ash mixed with loess over glaciofluvial deposits, glaciolacustrine deposits, or Latah Formation
Slope range: 0 to 25 percent

Elevation: 2,000 to 2,400 feet
Mean annual precipitation: 20 to 30 inches
Mean annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Fine-loamy, isotic, frigid Andic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 4 inches; brown (10YR 5/3) ashy very fine sandy loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; weakly smeary; many fine and medium and few coarse roots; common fine irregular pores; neutral; clear smooth boundary.

AB—4 to 8 inches; pale brown (10YR 6/3) ashy very fine sandy loam, brown (10YR 4/3) moist; moderate thin platy structure; soft, friable, nonsticky and nonplastic; weakly smeary; common fine and few medium and coarse roots; common very fine irregular pores; neutral; clear smooth boundary.

Bw—8 to 16 inches; light yellowish brown (10YR 6/4) ashy fine sandy loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common fine and few medium and coarse roots; common fine irregular pores; slightly acid; clear smooth boundary.

2E—16 to 24 inches; pale yellow (2.5Y 7/3) fine sandy loam, light olive brown (2.5Y 5/3) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common fine roots; many fine irregular pores; 1 percent gravel; slightly acid; gradual wavy boundary.

2E/Bt—24 to 36 inches; 70 percent pale yellow (2.5Y 7/3) loam, light olive brown (2.5Y 5/3) moist (E part); 30 percent light yellowish brown (2.5Y 6/4) loam, olive brown (2.5Y 4/4) moist (Bt part); moderate medium subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; few fine roots; many fine irregular pores; 20 percent distinct clay films on faces of peds; 1 percent gravel; neutral; gradual wavy boundary.

2Btx—36 to 51 inches; light yellowish brown (2.5Y 6/4) clay loam, olive brown (2.5Y 4/4) moist; strong coarse angular blocky structure; hard, firm, moderately sticky and moderately plastic; few fine roots; many fine irregular pores; 30 percent distinct clay films that are dark yellowish brown (10YR 4/4) moist and on faces of peds and 1 percent prominent organic stains that are black (10YR 2/1) moist; 2 percent distinct masses of oxidized iron that are yellowish brown (10YR 5/4) moist; 30 percent fragic properties; 1 percent gravel; neutral; clear wavy boundary.

3C1—51 to 57 inches; light yellowish brown (2.5Y 6/3) fine sandy loam, olive brown (2.5Y 4/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; common fine irregular pores; 2 percent distinct masses of oxidized iron that are yellowish brown (10YR 5/4) moist; slightly acid; clear wavy boundary.

3C2—57 to 60 inches; light yellowish brown (10YR 6/4) sandy clay loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, friable, moderately sticky and moderately plastic; common fine irregular pores; 2 percent prominent iron depletions that are dark grayish brown (2.5Y 4/2) moist and 2 percent faint masses of oxidized iron that are yellowish brown (10YR 5/4) moist; slightly acid.

Typical Pedon Location

Map unit in which located: Fan Lake ashy very fine sandy loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 5 miles northwest of Deer Park, Washington; about 200 feet south and 1,200 feet east of the northwest corner of section 9, T. 29 N., R. 42 E.

Range in Characteristics

Profile
Depth to argillic horizon—20 to 40 inches
Depth to fragic properties—20 to 40 inches
Depth to perched water table—16 to 24 inches in January through April
Depth to redoximorphic features—20 to 40 inches
Thickness of volcanic ash mantle with andic soil properties—7 to 14 inches
Thickness of volcanic ash influence without andic soil properties—5 to 14 inches

Ap horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—3 to 10 percent
Reaction—slightly acid, neutral

AB horizon
Chroma—3 or 4 dry or moist
Texture—ashy very sandy loam, ashy fine sandy loam, ashy silt loam
Clay content—3 to 10 percent
Reaction—slightly acid, neutral

Bw horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Clay content—3 to 10 percent
Reaction—slightly acid, neutral

2E horizon
Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture—fine sandy loam, sandy loam, loam
Clay content—3 to 8 percent
Gravel content—0 to 5 percent
Reaction—slightly acid, neutral

2E/Bt horizon
E part:
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—1 to 3 dry, 2 to 4 moist
Texture—fine sandy loam, sandy loam, loam
Clay content—5 to 10 percent

Bt part:
Hue—10YR, 2.5Y
Value—3 or 4 dry
Texture—loam
Clay content—18 to 25 percent
Gravel content—0 to 5 percent
Reaction—slightly acid, neutral

A 2Bt/E horizon is in some pedons.

2Btx horizon
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist

Chroma—3 or 4 dry or moist
Texture—loam, silty clay loam, clay loam
Clay content—18 to 35 percent
Gravel content—0 to 5 percent
Reaction—moderately acid to neutral

3C horizon
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—stratified sand, loamy fine sand, fine sandy loam, very fine sandy loam, silt loam, sandy clay loam, or silty clay loam
Clay content—3 to 35 percent
Reaction—moderately acid to neutral

Fluvaquents

Depth class: Very deep
Drainage class: Very poorly drained
Position on landscape: Flood plains, drainageways, low stream terraces
Parent material: Alluvium derived from mixed sources
Slope range: 0 to 3 percent
Elevation: 1,540 to 2,400 feet
Average annual precipitation: 18 to 28 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fluvaquents

Representative Pedon

Unless otherwise indicated, colors in the description are for moist soil.

A—0 to 1 inch; brown (10YR 4/3) sandy loam, brown (10YR 5/3) dry; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine and few medium roots; many very fine and fine tubular pores; 10 percent fine mica; neutral; abrupt smooth boundary.
C—1 to 4 inches; mixed brown (10YR 5/3 and 4/3) sand, pale brown (10YR 6/3) dry; single grain; loose, nonsticky and nonplastic; many very fine and fine and few medium roots; many fine interstitial pores; 2 percent fine distinct yellowish brown (10YR 5/6) iron-manganese masses and 10 percent fine and medium faint gray (10YR 6/1) iron depletions; 15 percent fine mica; neutral; abrupt wavy boundary.
Cg1—4 to 12 inches; dark gray (2.5Y 4/1) sandy loam, light yellowish brown (2.5Y 6/3) dry; massive; soft, friable, nonsticky and nonplastic; common very fine and fine roots; common very fine and fine tubular pores; 10 percent medium prominent gray (10YR 6/1) iron-manganese concretions and 20 percent medium distinct very dark gray (2.5Y 3/1) iron depletions; 10 percent fine mica; slightly acid; abrupt wavy boundary.
Cg2—12 to 21 inches; dark grayish brown (2.5Y 4/2) sandy loam, light brownish gray (2.5Y 6/2) dry; single grain; loose, nonsticky and nonplastic; common very fine and fine and few medium roots; many fine interstitial pores; 15 percent fine and medium prominent dark yellowish brown (10YR 3/6) iron-manganese masses and 10 percent fine distinct gray (2.5Y 6/1) iron depletions; 15 percent fine mica; 10 percent rounded gravel; slightly acid; clear wavy boundary.
Cg3—21 to 31 inches; very dark gray (7.5YR 3/1) sandy loam, gray (2.5Y 5/1) dry; massive; soft, friable, nonsticky and nonplastic; common very fine and fine roots; common very fine and few fine tubular pores; 20 percent fine and medium

prominent yellowish red (5YR 4/6) iron-manganese masses; 10 percent fine mica; slightly acid; clear wavy boundary.
Cg4—31 to 40 inches; black (5Y 2.5/1), stratified fine sandy loam and coarse sand, olive gray (5Y 5/2) dry; massive; soft, friable, nonsticky and nonplastic; few very fine roots; 5 percent fine prominent strong brown (7.5YR 4/6) iron-manganese masses; 5 percent fine mica; moderately acid; clear wavy boundary.
Cg5—40 to 60 inches; very dark gray (N 3/0), stratified coarse sand and sandy loam; single grain; loose, nonsticky and nonplastic; 10 percent gravel; neutral.

Representative Pedon Location

Map unit in which located: Endoaquolls and Fluvaquents, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 1/4 mile south of State Route 206, in Deadman Creek; about 1,055 feet south and 1,450 feet east of the northwest corner of section 2, T. 26 N., R. 43 E.

Range in Characteristics

Profile
Depth to apparent water table—soil surface to a depth of 4 inches in January through April, more than 4 inches in May through December
Depth to redoximorphic features—0 to 10 inches

A horizon
Value—2 to 4 moist, 5 or 6 dry
Chroma—2 to 4 moist or dry
Clay content—5 to 15 percent
Gravel content—0 to 10 percent
Reaction—slightly acid, neutral

C horizon
Value—3 to 5 moist, 5 or 6 dry
Chroma—2 to 4 moist or dry
Texture—sand, sandy loam, loam
Clay content—0 to 15 percent
Gravel content—0 to 15 percent
Reaction—slightly acid, neutral

Cg horizon
Hue—7.5YR to 2.5Y, neutral
Value—2.5 to 4 moist, 5 or 6 dry
Chroma—0 to 2 moist, 1 to 3 dry
Texture—stratified fine sandy loam and coarse sand; stratified sandy loam and coarse sand; sand; sandy loam; fine sandy loam; loamy sand
Clay content—0 to 15 percent
Gravel content—0 to 55 percent
Cobble content—0 to 15 percent
Total rock fragment content—0 to 55 percent
Reaction—moderately acid to neutral

Fourmound Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Patterned ground mounds on basalt plateaus of channeled scablands
Parent material: Glaciofluvial deposits and loess mixed with a minor amount of volcanic ash over residuum derived from basalt

Slope range: 0 to 15 percent
Elevation: 1,800 to 2,600 feet
Average annual precipitation: 15 to 22 inches
Average annual air temperature: 46 to 52 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Coarse-loamy, isotic, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 4 inches; brown (10YR 4/3) gravelly ashy silt loam, very dark grayish brown (10YR 3/2) moist; strong fine and medium granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine and medium roots; many very fine, fine, and medium irregular pores; 15 percent subangular basalt gravel; slightly acid; diffuse smooth boundary.

A2—4 to 9 inches; brown (10YR 5/3) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine and medium roots; many very fine irregular pores and few fine tubular pores; 10 percent subangular basalt gravel; slightly acid; gradual smooth boundary.

A3—9 to 15 inches; yellowish brown (10YR 5/4) ashy silt loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and few fine, medium, and coarse roots; many very fine irregular pores and few fine and medium tubular pores; 10 percent subangular basalt gravel; slightly acid; gradual wavy boundary.

Bw1—15 to 30 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine, fine, and coarse and common medium roots; many very fine irregular pores and few fine and medium tubular pores; 10 percent subangular basalt gravel; slightly acid; gradual wavy boundary.

Bw2—30 to 43 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine irregular pores and few very fine and fine tubular pores; 2 percent patchy faint organic stains; 10 percent subangular basalt gravel; moderately acid; diffuse wavy boundary.

2BC—43 to 47 inches; light yellowish brown (10YR 6/4) extremely gravelly silt loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few very fine and common fine roots matted around gravel; many very fine irregular pores and few fine tubular pores; 70 percent subangular basalt gravel; moderately acid; diffuse wavy boundary.

2R—47 inches; unweathered basalt.

Typical Pedon Location

Map unit in which located: Rockly-Fourmound complex, 0 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 4.5 miles west of Nine Mile Falls, Washington; about 1,700 feet south and 700 feet east of section 16, T. 26 N., R. 41 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—10 to 20 inches

Depth to bedrock—40 to 60 inches (lithic)
Clay content in particle-size control section—4 to 18 percent

An O horizon is in some pedons.

A horizon
Hue—7.5YR, 10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—3 or 4 dry, 1 to 3 moist
Texture—ashy silt loam in upper part, ashy silt loam or ashy loam in lower part
Clay content—4 to 18 percent
Gravel content—2 to 20 percent

Bw horizon
Hue—7.5YR, 10YR, 2.5Y
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam
Clay content—4 to 18 percent
Gravel content—2 to 20 percent
Reaction—moderately acid, slightly acid

2BC horizon, and 2C horizon (where present)
Hue—7.5YR, 10YR, 2.5YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam
Clay content—5 to 15 percent
Gravel content—35 to 80 percent
Cobble content—0 to 20 percent
Total rock fragment content—35 to 80 percent

In some pedons, the 2BC and 2C horizons also contain mixed glacial flood gravel.

Freeman Series

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Summits and backslopes of loess hills on basalt plateaus
Parent material: Loess with an influence of volcanic ash in the upper part over older loess
Slope range: 0 to 25 percent
Elevation: 2,400 to 2,660 feet
Average annual precipitation: 20 to 25 inches
Average annual air temperature: 45 to 48 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Aquandic Palexeralfs (fig. 25)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 2 inches; pale brown (10YR 6/3) ashy silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly

Figure 25.—Typical profile of a Freeman soil. Numerals on tape indicate inches.

sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; moderately acid; clear smooth boundary.

Ap2—2 to 9 inches; pale brown (10YR 6/3) ashy silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure parting to moderate medium platy; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and few fine tubular pores; strongly acid; clear smooth boundary.

E—9 to 15 inches; very pale brown (10YR 7/3) silt loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine tubular pores and few fine irregular pores; slightly acid; abrupt smooth boundary.

Ec—15 to 21 inches; light gray (10YR 7/2) silt loam, brown (10YR 5/3) moist; weak medium angular blocky structure; hard, firm, nonsticky and slightly plastic; few very fine roots; common very fine irregular pores; 1 percent very fine prominent masses

of oxidized iron and 2 percent very fine prominent iron-manganese concretions; neutral; abrupt wavy boundary.

Btb/E—21 to 29 inches; 75 percent light yellowish brown (10YR 6/4) silty clay loam, yellowish brown (10YR 5/4) moist (Btb part); moderate medium subangular blocky structure; very hard, very firm, moderately sticky and moderately plastic; 10 percent distinct silt coatings and 20 percent distinct clay films on faces of peds; very pale brown (10YR 8/3) silt loam, very pale brown (10YR 7/3) moist (E part); very hard, very firm, slightly sticky and slightly plastic; 25 percent slightly brittle; few very fine roots; few very fine tubular pores and common very fine irregular pores; 2 percent fine prominent iron-manganese concretions, 2 percent fine prominent redoximorphic concentrations that are strong brown (7.5YR 5/6) moist, and 10 percent fine and medium prominent redoximorphic depletions that are grayish brown (2.5Y 5/2) moist; neutral; abrupt wavy boundary.

Btb1—29 to 39 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; strong coarse angular blocky structure parting to strong medium angular blocky; very hard, very firm, moderately sticky and slightly plastic; few very fine roots between peds; few very fine tubular pores; 5 percent prominent organic stains, 20 percent distinct silt coatings, and 30 percent distinct clay films on faces of peds; 5 percent fine prominent iron-manganese concretions, 10 percent medium and coarse distinct redoximorphic depletions that are grayish brown (2.5Y 5/2) moist, and 5 percent medium prominent redoximorphic concentrations that are brown (7.5YR 5/3) moist; neutral; gradual wavy boundary.

Btb2—39 to 53 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; strong coarse prismatic structure; very hard, very firm, very sticky and very plastic; few very fine roots between peds; few very fine tubular pores; 5 percent prominent organic stains, 10 percent distinct silt coatings, and 50 percent distinct clay films on faces of peds; 2 percent fine prominent iron-manganese concretions, 2 percent medium prominent redoximorphic concentrations that are brown (7.5YR 5/3) moist, and 5 percent medium distinct redoximorphic depletions that are light olive brown (2.5Y 5/3) moist; neutral; clear wavy boundary.

Btb3—53 to 62 inches; yellowish brown (10YR 5/4) silty clay loam, dark yellowish brown (10YR 3/4) moist; strong medium prismatic structure; very hard, very firm, very sticky and very plastic; few very fine roots between peds; few very fine tubular pores; 5 percent prominent organic stains, 20 percent faint silt coatings that are light gray (10YR 7/2) moist, and 80 percent prominent clay films on faces of peds; 2 percent fine prominent iron-manganese concretions; neutral.

Typical Pedon Location

Map unit in which located: Freeman ashy silt loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 4.5 miles southeast of the town of Freeman, Washington; about 1.2 miles south of Elder Road, on Harvard Road; about 190 feet west and 870 feet north of the southeast corner of section 9, T. 23 N., R. 45 E.

Range in Characteristics

Profile

Thickness of volcanic ash influence—7 to 10 inches

Depth to argillic horizon—15 to 30 inches

Depth to perched water table—14 to 21 inches in January through April

Depth to redoximorphic features—14 to 21 inches

Clay content—averages 20 to 35 percent in particle-size control section and 27 to 40 percent in lower part of argillic horizon

Ap horizon
Value—3 or 4 moist
Chroma—2 or 3 dry or moist
Clay content—15 to 18 percent
Reaction—strongly acid, moderately acid

E or Ec horizon
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 or 3 dry, 2 to 4 moist
Clay content—12 to 17 percent
Reaction—strongly acid to neutral

The E horizon coats peds in the upper part of the Btb horizon in some pedons.

Btb/E horizon
Hue—10YR, 2.5Y
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 to 4 dry, 3 to 5 moist
Texture—silty clay loam, silt loam
Clay content—22 to 35 percent
Reaction—strongly acid to neutral

Btb horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 moist
Texture—silty clay loam, silty clay
Clay content—27 to 45 percent
Reaction—strongly acid to neutral

Garfield Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Shoulders, summits, and backslopes of loess hills
Parent material: Loess
Slope range: 3 to 35 percent
Elevation: 2,200 to 2,880 feet
Mean annual precipitation: 18 to 22 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine, mixed, superactive, mesic Mollic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Ap1—0 to 5 inches; very dark grayish brown (10YR 3/2) silt loam, brown (10YR 5/3) dry; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine tubular pores; slightly acid (pH 6.2); abrupt wavy boundary.
Ap2—5 to 8 inches; very dark grayish brown (10YR 3/2) silt loam, brown (10YR 4/3) dry; weak fine subangular blocky structure; slightly hard, friable, slightly sticky

and slightly plastic; many very fine and fine roots; many very fine and fine tubular pores; slightly acid (pH 6.2); clear wavy boundary.

Btb1—8 to 19 inches; dark yellowish brown (10YR 4/4) silty clay loam, yellowish brown (10YR 5/4) dry; moderate coarse subangular blocky structure; very hard, extremely firm, moderately sticky and very plastic; few very fine roots between peds; common very fine and few fine tubular pores; 40 percent continuous distinct clay films that are dark yellowish brown (10YR 3/4) moist and on faces of peds; 5 percent fine moderately cemented manganese nodules in matrix; neutral (pH 6.9); gradual wavy boundary.

Btb2—19 to 32 inches; dark yellowish brown (10YR 4/4) silty clay, yellowish brown (10YR 5/4) dry; moderate coarse subangular blocky structure; hard, very firm, moderately sticky and very plastic; few very fine roots between peds; few very fine and fine tubular pores; 35 percent continuous distinct clay films that are dark brown (10YR 3/3) moist and on faces of peds; 5 percent fine moderately cemented manganese nodules in matrix; neutral (pH 7.0); gradual wavy boundary.

Btb3—32 to 45 inches; dark yellowish brown (10YR 4/4) silty clay loam, yellowish brown (10YR 5/4) dry; moderate medium prismatic structure parting to moderate coarse subangular blocky; moderately hard, firm, slightly sticky and moderately plastic; few very fine roots between peds; few very fine and fine tubular pores; 35 percent continuous distinct clay films that are dark brown (10YR 3/3) moist and on faces of peds; 2 percent fine moderately cemented manganese nodules in matrix; neutral (pH 7.0); gradual wavy boundary.

Btb4—45 to 60 inches; brown (10YR 4/3) silty clay loam, light yellowish brown (10YR 6/4) dry; moderate coarse prismatic structure parting to moderate coarse subangular blocky; moderately hard, firm, slightly sticky and moderately plastic; few very fine tubular pores; 35 percent continuous distinct clay films that are dark brown (10YR 3/3) moist and on faces of peds; 2 percent fine moderately cemented manganese nodules in matrix; neutral (pH 7.0).

Typical Pedon Location

Map unit in which located: Naff-Garfield complex, 3 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 2,850 feet south and 2,740 feet east of the northwest corner of section 6, T. 22 N., R. 44 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—0 to 8 inches
Clay content in particle-size control section—35 to 45 percent
Depth to bottom of argillic horizon—more than 40 inches

Ap horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry, 1 to 3 moist
Texture—silt loam, silty clay loam
Clay content—15 to 30 percent
Reaction—moderately acid to neutral

Btb1 and Btb2 horizons

Hue—7.5YR, 10YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, silty clay
Clay content—35 to 45 percent
Reaction—neutral to moderately alkaline

Btb3 and Btb4 horizons
Hue—7.5YR, 10YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—20 to 40 percent
Calcium carbonate content—0 to 2 percent
Reaction—neutral to moderately alkaline

Garrison Series

Depth class: Very deep
Drainage class: Somewhat excessively drained
Position on landscape: Outwash plains
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 30 percent
Elevation: 1,800 to 2,150 feet
Average annual precipitation: 18 to 24 inches
Average annual air temperature: 46 to 49 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, isotic, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 4 inches; dark grayish brown (10YR 4/2) very gravelly ashy loam, very dark brown (10YR 2/2) moist; weak fine and medium granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular pores; 35 percent gravel and 5 percent cobbles; neutral; abrupt smooth boundary.
A2—4 to 16 inches; dark grayish brown (10YR 4/2) very gravelly ashy loam, very dark brown (10YR 2/2) moist; weak medium and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; common fine irregular pores; 35 percent gravel and 5 percent cobbles; neutral; gradual wavy boundary.
Bw—16 to 24 inches; brown (10YR 5/3) very gravelly loam, dark brown (7.5YR 3/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and common fine roots; common fine irregular pores; 40 percent gravel and 5 percent cobbles; neutral; diffuse wavy boundary.
C—24 to 60 inches; brown (10YR 5/3) extremely gravelly loamy coarse sand, dark brown (7.5YR 3/4) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; many fine interstitial pores; 55 percent gravel, 10 percent cobbles, and 5 percent stones; slightly alkaline.

Typical Pedon Location

Map unit in which located: Garrison very gravelly ashy loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 5 miles east of Millwood, Washington; about 2,400 feet north and 2,750 feet east of the southwest corner of section 6, T. 25 N., R. 45 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—12 to 20 inches
Thickness of volcanic ash influence—12 to 20 inches
Depth to secondary carbonates—44 to 60 inches or more
Depth to sandy skeletal horizons—24 to 36 inches
Percentage of surface covered with rock fragments—0 to 15 percent stones of mixed origin, including siltite, argillite, gneiss, granite, and basalt
Rock fragment content—averages 35 to 70 percent in particle-size control section

A1 horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—10 to 18 percent
Gravel content—35 to 55 percent
Cobble content—0 to 10 percent
Stone content—0 to 5 percent
Reaction—moderately acid to neutral

A2 horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Texture—ashy loam, ashy silt loam
Clay content—10 to 18 percent
Gravel content—35 to 55 percent
Cobble content—0 to 20 percent
Stone content—0 to 15 percent
Total rock fragment content—35 to 55 percent
Reaction—moderately acid to neutral

Bw horizon
Hue—7.5YR, 10YR
Value—4 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—loam, sandy loam, coarse sandy loam
Clay content—5 to 15 percent
Gravel content—35 to 60 percent
Cobble content—0 to 35 percent
Stone content—0 to 35 percent
Total rock fragment content—35 to 75 percent
Reaction—slightly acid to neutral

C horizon
Hue—7.5YR, 10YR, 2.5Y
Value—5 to 7 dry, 3 to 6 moist
Chroma—3 to 5 dry or moist
Texture—sand, coarse sand, loamy coarse sand; stratified in some pedons
Clay content—0 to 5 percent
Gravel content—30 to 75 percent
Cobble content—5 to 20 percent
Stone content—0 to 25 percent
Total rock fragment content—40 to 85 percent
Reaction—slightly acid to slightly alkaline

Content of calcium carbonate and silica coatings—0 to 15 percent, on underside of rock fragments

Gibbs Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes and summits of basalt plateaus
Parent material: Colluvium and residuum derived from basalt and a minor amount of glaciofluvial deposits, loess, and volcanic ash in the upper part
Slope range: 0 to 15 percent
Elevation: 1,900 to 2,600 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-loamy, isotic, mesic Vitrandic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, twigs, and leaves mixed with 1980's Mount St. Helens volcanic ash.
A—1 to 5 inches; brown (10YR 4/3) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; many very fine and fine tubular pores and many fine irregular pores; neutral; clear wavy boundary.
AB—5 to 13 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; moderate coarse subangular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular pores; neutral; clear wavy boundary.
Bt1—13 to 20 inches; yellowish brown (10YR 5/3) silty clay loam, dark brown (10YR 3/3) moist; moderate coarse subangular blocky structure; very hard, firm, slightly sticky and moderately plastic; common very fine, fine, and medium roots; common very fine and few fine tubular pores; 10 percent faint clay films on faces of peds; 2 percent gravel; slightly acid; gradual wavy boundary.
Bt2—20 to 31 inches; yellowish brown (10YR 5/4) silty clay loam, dark yellowish brown (10YR 3/4) moist; moderate medium and coarse subangular blocky structure; very hard, firm, slightly sticky and moderately plastic; few very fine, fine, and medium roots; common very fine and few fine tubular pores; 25 percent faint clay films on faces of peds; 5 percent gravel; neutral; clear wavy boundary.
BCt—31 to 35 inches; yellowish brown (10YR 5/4) very gravelly silt loam, dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure; very hard, very firm, slightly sticky and moderately plastic; few very fine, fine, and medium roots; few very fine and fine tubular pores; 20 percent faint clay films on faces of peds; 30 percent gravel and 20 percent cobbles; neutral; abrupt wavy boundary.
2R—35 inches; unweathered basalt that has fractures 4 to 18 inches apart; about 1 inch thick weathering rinds in fractures.

Typical Pedon Location

Map unit in which located: Gibbs ashy silt loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 1.25 miles southwest of Mica Washington; about 800 feet west and 1,960 feet south of the northeast corner of section 28, T. 24 N., R. 44 E.

Range in Characteristics

Profile
Depth to bedrock—20 to 40 inches (lithic)
Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—7 to 14 inches
Reaction—slightly acid, neutral
Clay content in particle-size control section—18 to 30 percent
Rock fragment content in particle-size control section—averages less than 35 percent

A horizon, or Ap horizon (where present)
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—12 to 18 percent
Gravel content—0 to 5 percent

AB horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—16 to 22 percent
Gravel content—0 to 5 percent

Bt horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Texture—silt loam, loam, silty clay loam
Clay content—18 to 30 percent
Gravel content—0 to 10 percent

BCt or C horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—4 or 6 dry or moist
Texture—silt loam, loam, silty clay loam
Gravel content—30 to 60 percent
Cobble content—0 to 25 percent
Total rock fragment content—35 to 75 percent

Glenrose Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits, shoulders, and backslopes of hills
Parent material: Loess mixed with a minor amount of volcanic ash over material derived from saprolitic gneiss, quartzite, or Latah Formation
Slope range: 0 to 25 percent
Elevation: 2,200 to 2,900 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 45 to 48 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-loamy, isotic, mesic Vitrandic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 8 inches; brown (10YR 5/3) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular and irregular pores; moderately acid; clear smooth boundary.

AB—8 to 14 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 3/3) moist; weak coarse subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular and irregular pores; slightly acid; clear wavy boundary

Bw—14 to 19 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine and fine tubular pores; 15 percent distinct clay films on faces of peds; slightly acid; clear wavy boundary.

Bt/E—19 to 24 inches; 85 percent dark yellowish brown (10YR 4/4) silty clay loam, brown (10YR 4/3) moist (Bt part); moderate medium subangular blocky structure; hard, firm, slightly sticky and moderately plastic; 60 percent distinct clay films on faces of peds; 15 percent pale brown (10YR 6/3) silty clay loam, brown (10YR 5/3) moist (E part); moderate medium subangular blocky structure; hard, firm, slightly sticky and moderately plastic; few very fine roots; common very fine tubular pores; 2 percent fine gravel; neutral; clear wavy boundary.

Bt1—24 to 32 inches; yellowish brown (10YR 5/4) silty clay loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, firm, moderately sticky and moderately plastic; few very fine roots; common very fine tubular pores; 15 percent distinct silt coatings on faces of peds and 50 percent distinct clay films on faces of peds; 5 percent gravel; neutral; gradual wavy boundary.

Bt2—32 to 41 inches; yellowish brown (10YR 5/6) clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; hard, firm, moderately sticky and moderately plastic; few very fine roots; common very fine tubular pores; 10 percent distinct silt coatings on faces of peds and 30 percent distinct clay films on faces of peds; 5 percent gravel; neutral; gradual wavy boundary.

Bt3—41 to 60 inches; yellowish brown (10YR 5/6) clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; hard, firm, moderately sticky and moderately plastic; common very fine tubular and irregular pores; 25 percent faint clay films on faces of peds; 10 percent gravel; neutral.

Typical Pedon Location

Map unit in which located: Glenrose ashy silt loam, 8 to 25 percent slopes

Location in survey area: Spokane County, Washington, about 2 miles east of Mica, Washington; about 610 feet east and 905 feet south of the northwest corner of section 19, T. 24 N., R. 45 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 20 inches

Thickness of volcanic ash influence—7 to 14 inches

Clay content in particle-size control section—18 to 34 percent

Percentage of surface covered with cobbles—0.0 to 0.1 percent

Ap horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—14 to 18 percent
Gravel content—0 to 10 percent
Cobble content—0 to 15 percent
Reaction—moderately acid, slightly acid

AB horizon
Value—4 or 5 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—14 to 18 percent
Gravel content—0 to 10 percent
Reaction—moderately acid to neutral

Bw horizon
Value—5 to 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, loam
Clay content—16 to 20 percent
Fine gravel content—0 to 15 percent
Reaction—slightly acid, neutral

Bt/E horizon
Hue—10YR, 7.5YR, 5YR
Value—4 to 7 dry, 3 to 5 moist
Chroma—3 to 5 dry or moist
Texture—silty clay loam, clay loam, loam
Clay content—18 to 30 percent
Gravel content—0 to 15 percent
Reaction—slightly acid, neutral

Bt horizon
Value—4 to 7 dry, 3 to 5 moist
Chroma—3 to 6 dry or moist
Texture—silty clay loam, clay loam, loam
Clay content—22 to 28 percent in upper part, 28 to 34 percent in lower part
Gravel content—0 to 15 percent
Reaction—slightly acid, neutral

Green Bluff Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Outwash plains on basalt plateaus
Parent material: Loess mixed with a minor amount of volcanic ash over glaciofluvial deposits
Slope range: 0 to 15 percent
Elevation: 1,900 to 2,400 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Coarse-loamy, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 7 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 4/2) moist; weak very thin platy structure and weak fine granular; slightly hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; few fine tubular and irregular pores; 5 percent gravel; slightly acid; abrupt smooth boundary.

E and Bt1—7 to 17 inches; pale brown (10YR 6/3) ashy silt loam, brown (10YR 4/3) moist (E part); few fine faint organic stains that are brown (7.5YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; two irregular wavy continuous 1/4-inch-thick lamellae that are dark yellowish brown (10YR 4/4) moist (Bt part); many fine roots; many fine tubular and irregular pores; 5 percent gravel; neutral; abrupt smooth boundary.

E and Bt2—17 to 29 inches; light gray (10YR 7/2) and very pale brown (10YR 7/3) silt loam, dark brown (10YR 3/3) moist (E part); common faint organic stains that are brown (7.5YR 5/4) moist; weak fine and medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; three irregular wavy continuous 1-inch-thick horizontal bands of lamellae that are dark brown (10YR 4/3) moist and have 10 percent distinct clay films in pores and on surfaces of peds; few fine roots; many fine tubular and irregular pores; 10 percent gravel; neutral; gradual wavy boundary.

E and Bt3—29 to 55 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist (E part); moderate fine subangular blocky structure; hard, firm, moderately sticky and moderately plastic; three 1/2-inch-thick lamellae that are light brownish gray (10YR 4/2) and brown (7.5YR 4/3) moist (Bt part) and have 20 percent distinct clay films in pores and on faces of peds; few fine roots; many fine tubular and irregular pores; 15 percent rounded gravel and 2 percent subrounded cobbles; neutral; abrupt wavy boundary.

C—55 to 60 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; massive; hard, firm, moderately sticky and moderately plastic; thin layers of sandy material 1/4 to 1/2 inch thick; discontinuous bands of lamellae 1/2 to 1 inch thick with 2 percent faint clay films in pores and root channels; very few fine roots; 2 percent brown (10YR 4/3) medium organic stains; few fine and medium tubular and irregular pores; 5 percent gravel; neutral.

Typical Pedon Location

Map unit in which located: Green Bluff ashy silt loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 3.5 miles east of Colbert, Washington; about 1,000 feet south and 400 feet west of the northeast corner of section 20, T. 27 N., R. 44 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—5 to 9 inches
Thickness of volcanic ash influence—7 to 14 inches
Rock fragment content—0 to 20 percent in particle-size control section
Clay content in particle-size control section—5 to 15 percent
Reaction—slightly acid, neutral
Total combined thickness of lamellae—less than 6 inches

Ap horizon

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—2 or 3 dry or moist
Clay content—5 to 12 percent

E and Bt1 horizon
E part (90 to 95 percent of horizon):
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy loam, ashy silt loam
Gravel content—0 to 10 percent
Cobble content—0 to 5 percent
Total rock fragment content—0 to 10 percent

Bt part (5 to 10 percent of horizon):
Value—4 or 5 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist

E and Bt2 horizon and E and Bt3 horizon
E part (90 to 95 percent of horizon):
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—loam, silt loam
Gravel content—0 to 15 percent
Cobble content—0 to 5 percent
Total rock fragment content—0 to 20 percent

Bt part (5 to 10 percent of horizon):
Value—4 to 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist

C horizon
Hue—10YR, 2.5Y
Value—5 to 7 dry, 2 to 5 moist
Chroma—3 or 4 moist or dry
Texture—silt loam, loam, fine sandy loam
Gravel content—5 to 15 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 15 percent

Hagen Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash terraces
Parent material: Sandy glaciofluvial deposits mixed with a minor amount of loess and volcanic ash in the upper part
Slope range: 0 to 25 percent
Elevation: 1,800 to 2,400 feet
Average annual precipitation: 18 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Sandy, isotic, mesic Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 7 inches; brown (10YR 5/3) ashy sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, very friable, nonsticky and

nonplastic; many very fine and fine roots; common very fine irregular pores; slightly acid; abrupt wavy boundary.

Bw—7 to 15 inches; brown (10YR 6/3) ashy sandy loam, pale brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and fine and few medium roots; common very fine irregular pores; slightly acid; gradual smooth boundary.

E and Bt1—15 to 29 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few discontinuous wavy bands of yellowish brown (10YR 5/4) loamy sand, dark yellowish brown (10YR 4/4) moist (Bt part); common very fine and fine and few medium roots; common very fine irregular pores; 1 percent gravel; neutral; gradual wavy boundary.

E and Bt2—29 to 52 inches; light yellowish brown (10YR 6/4) loamy sand, dark yellowish brown (10YR 4/4) moist; single grain; loose, nonsticky and nonplastic; many $^{3}/_{16}$-inch-thick continuous wavy bands of dark yellowish brown (10YR 4/6) loamy sand, dark yellowish brown (10YR 4/4) moist (Bt part); common very fine and fine roots; common very fine interstitial pores; neutral; gradual wavy boundary.

C—52 to 60 inches; light yellowish brown (10YR 6/4) sand, dark yellowish brown (10YR 4/4) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; common very fine interstitial pores; neutral.

Typical Pedon Location

Map unit in which located: Hagen ashy sandy loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 1.25 miles north of Dartford, Washington; about 300 feet north and 2,550 feet east of the southwest corner of section 30, T. 27 N., R. 43 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—4 to 8 inches
Thickness of volcanic ash influence—7 to 20 inches
Depth to sand or loamy sand—15 to 20 inches
Reaction—slightly acid or neutral throughout

A horizon

Value—5 or 6 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—4 to 10 percent
Gravel content—0 to 5 percent

Bw horizon (where present)

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy fine sandy loam
Clay content—4 to 10 percent
Gravel content—0 to 5 percent

E and Bt horizon

E part (90 to 95 percent of horizon):
Hue—10YR, 2.5Y
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy sand, sand
Clay content—0 to 5 percent
Gravel content—0 to 10 percent

Bt part (5 to 10 percent of horizon):
Value—4 to 6 dry, 4 or 5 moist
Chroma—4 or 6 dry or moist
Texture—sandy loam, loamy sand
Clay content—4 to 10 percent
Total thickness of lamellae—less than 6 inches

C horizon
Hue—10YR, 2.5Y, variegated
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 moist or dry
Texture—loamy sand, sand
Clay content—0 to 5 percent
Gravel content—0 to 10 percent

Hanning Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes, shoulders, and footslopes of loess hills on basalt plateaus
Parent material: Loess
Slope range: 8 to 60 percent
Elevation: 2,200 to 2,690 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Pachic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 9 inches; dark gray (10YR 4/1) silt loam, black (10YR 2/1) moist; weak coarse subangular blocky structure parting to weak medium granular; very friable, soft, slightly sticky and slightly plastic; many very fine roots; many very fine irregular pores; moderately acid; abrupt wavy boundary.

A—9 to 17 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; moderate fine prismatic structure parting to moderate medium subangular blocky; very friable, soft, slightly sticky and moderately plastic; many very fine roots; many very fine dendritic tubular pores; moderately acid; clear wavy boundary.

AB—17 to 24 inches; grayish brown (10YR 5/2) silt loam, very dark gray (10YR 3/1) moist; moderate medium prismatic structure parting to moderate fine subangular blocky; very friable, soft, slightly sticky and moderately plastic; many very fine roots; common medium irregular pores and many very fine dendritic tubular pores; neutral; clear wavy boundary.

Bt1—24 to 35 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium prismatic structure; very friable, soft, moderately sticky and moderately plastic; many very fine roots; common medium irregular pores and many very fine dendritic tubular pores; 10 percent distinct clay films on faces of peds; neutral; clear wavy boundary.

Bt2—35 to 45 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; moderate medium prismatic structure; friable, slightly hard, moderately sticky and moderately plastic; common very fine roots; many very fine irregular

pores; 20 percent distinct clay films on faces of peds; neutral; clear wavy boundary.

Bt3—45 to 63 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; moderate medium prismatic structure; friable, slightly hard, moderately sticky and moderately plastic; common very fine roots; many very fine dendritic tubular pores and common very fine irregular pores; 5 percent faint silt coatings and 30 percent distinct clay films on faces of peds; neutral.

Typical Pedon Location

Map unit in which located: Hanning silt loam, 8 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 1,770 feet north and 2,090 feet east of the southwest corner of section 11, T. 22 N., R. 40 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—20 to 35 inches
Depth to argillic horizon—20 to 40 inches
Clay content in particle-size control section—18 to 27 percent

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Texture—silt loam
Clay content—10 to 18 percent
Reaction—moderately acid, slightly acid

Bt horizon
Value—4 to 6 dry, 3 or 4 moist
Chroma—2 to 4 moist or dry

AB horizon
Absent in some pedons

An E horizon is above the Bt horizon in some pedons

Haploxerolls

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Treads of stream terraces
Parent material: Mixed alluvium
Slope range: 0 to 8 percent
Elevation: 1,540 to 2,400 feet
Average annual precipitation: 17 to 21 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Haploxerolls

Representative Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 4 inches; grayish brown (10YR 5/2) ashy silt loam, very dark gray (10YR 3/1) moist; moderate very thick platy structure parting to moderate fine subangular blocky; friable, slightly hard, slightly sticky and slightly plastic; common fine and medium and many very fine roots throughout; common very fine tubular pores; neutral; clear smooth boundary.

A2—4 to 14 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak very thick platy structure parting to moderate medium subangular blocky; very friable, slightly hard, slightly sticky and slightly plastic; few fine and common very fine roots throughout; common very fine tubular pores; neutral; clear smooth boundary.

A3—14 to 30 inches; brown (10YR 5/3) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak very thick platy structure parting to moderate medium subangular blocky; friable, slightly hard, slightly sticky and slightly plastic; few fine and common very fine roots throughout; common very fine tubular pores; neutral; clear smooth boundary.

A4—30 to 40 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate very thick platy structure parting to moderate medium subangular blocky; very friable, slightly hard, slightly sticky and slightly plastic; few fine and common very fine roots throughout; common very fine tubular pores; slightly alkaline; abrupt smooth boundary.

Ab1—40 to 57 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate very thick platy structure parting to moderate medium subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; few fine and common very fine roots throughout; common very fine tubular pores; 10 percent fine and medium distinct masses of oxidized iron that are dark brown (7.5YR 3/4) moist and are along pores and on faces of peds; slightly alkaline; abrupt wavy boundary.

Ab2—57 to 60 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; massive; very friable, slightly hard, nonsticky and nonplastic; common very fine roots throughout; many very fine irregular pores and few very fine tubular pores; neutral.

Representative Pedon Location

Map unit in which located: Haploxerolls ashy silt loam, channeled, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 1,200 feet south of the intersection of Hangman Valley and Pinehill Roads; about 2,350 feet north and 800 feet east of the southwest corner of section 21, T. 24 N., R. 43 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—20 to 60 inches
Thickness of volcanic ash influence—4 to 30 inches
Depth to apparent water table—40 to 50 inches in February through May
Depth to redoximorphic concentrations—40 to 60 inches
Reaction—neutral, slightly alkaline

A1 and A2 horizons

Value—4 to 5 dry, 2 or 3 moist
Chroma—1 to 3 moist or dry
Texture—ashy silt loam, ashy fine sandy loam, loam, silt loam
Clay content—10 to 20 percent
Gravel content—0 to 10 percent

A3 and A4 horizons

Value—4 to 6 dry, 2 to 4 moist
Chroma—2 to 4 moist or dry
Texture—ashy fine sandy loam, fine sandy loam, loam, sandy loam, silt loam
Clay content—5 to 18 percent
Gravel content—0 to 30 percent

Cobble content—0 to 10 percent
Total rock fragment content—0 to 30 percent

Ab horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 moist or dry
Texture—fine sandy loam, loam, sandy loam, silt loam
Clay content—3 to 18 percent
Gravel content—0 to 30 percent
Cobble content—0 to 10 percent
Total rock fragment content—0 to 30 percent

A C horizon is in some pedons.

Hardesty Series

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Depressions of channeled scablands, stream terraces, drainageways
Parent material: Alluvium derived from volcanic ash mixed with loess in the upper part
Slope range: 0 to 3 percent
Elevation: 1,900 to 2,450 feet
Average annual precipitation: 15 to 25 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Ashy, glassy, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 4 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; moderate thin platy structure parting to moderate medium granular; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots throughout; many very fine and fine irregular pores; slightly acid; abrupt smooth boundary.
A2—4 to 11 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 3/3) moist; weak medium platy structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots throughout; many very fine and fine irregular pores; slightly acid; clear smooth boundary.
Bw1—11 to 23 inches; pale brown (10YR 6/3) ashy silt loam, brown (10YR 4/3) moist; moderate thick platy structure parting to weak medium subangular blocky; soft, friable, slightly sticky and slightly plastic; common very fine and fine roots throughout; many very fine and few fine irregular pores; few medium distinct brown (7.5YR 4/4) masses of iron-manganese accumulation in matrix; neutral; clear wavy boundary.
Bw2—23 to 32 inches; very pale brown (10YR 7/3) ashy silt loam, brown (10YR 5/3) moist; moderate thick platy structure parting to weak medium subangular blocky; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine and fine irregular pores; common medium distinct brown (7.5YR 4/4) masses of iron-manganese accumulation in matrix; neutral; abrupt wavy boundary.
C1—32 to 39 inches; very pale brown (10YR 7/4) ashy very fine sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, friable, nonsticky and nonplastic; common

very fine and fine roots; few fine irregular pores; few medium distinct brown (7.5YR 4/4) masses of iron-manganese accumulation in matrix; neutral; abrupt wavy boundary.

C2—39 to 60 inches; very pale brown (10YR 8/3) ashy loamy very fine sand, pale brown (10YR 6/3) moist; massive; soft, friable, nonsticky and nonplastic; few very fine and fine roots; few fine irregular pores; coarsely laminated with thin wavy bands that are brown (7.5YR 4/4) moist; neutral.

Typical Pedon Location

Map unit in which located: Hardesty ashy silt loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 3 miles south of the community of Greenacres, Washington; about 2,600 feet west and 1,800 feet south of the northeast corner of section 35, T. 25 N., R. 44 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 15 inches
Depth to apparent water table—23 to 30 inches in February
Depth to redoximorphic features—20 to 60 inches
Volcanic glass content—more than 60 percent in particle-size control section
Reaction—slightly acid, neutral

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—10 to 15 percent
Gravel content—0 to 5 percent

Bw horizon

Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Texture—ashy silt loam, ashy very fine sandy loam
Clay content—5 to 15 percent
Gravel content—0 to 10 percent

C horizon

Value—6 to 8 dry, 4 to 6 moist
Chroma—2 to 4 dry or moist
Texture—ashy loamy very fine sand, ashy silt, ashy silt loam, ashy very fine sandy loam
Clay content—0 to 5 percent
Gravel content—0 to 10 percent

Hoodoo Taxadjunct

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Flood plains
Parent material: Alluvium derived from volcanic ash mixed with loess in the upper part
Slope range: 0 to 3 percent
Elevation: 1,600 to 2,500 feet
Average annual precipitation: 18 to 32 inches
Average annual air temperature: 42 to 46 degrees F
Frost-free period: 80 to 110 days

Taxonomic class: Ashy, glassy, nonacid, frigid Aquandic Humaquepts (fig. 26)

Taxadjunct Features

The Hoodoo soils in this survey area are a taxadjunct to the series because they do not have andic soil properties. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Figure 26.—Typical profile of a Hoodoo soil. Numerals on tape indicate centimeters.

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Ap—0 to 10 inches; very dark grayish brown (10YR 3/2) ashy silt loam, grayish brown (10YR 5/2) dry; weak medium subangular blocky structure parting to moderate medium granular; soft, friable, slightly sticky and slightly plastic; slightly fluid; many very fine and fine roots; many very fine and fine tubular and irregular pores; 2 percent fine distinct dark yellowish brown (10YR 4/6) masses of oxidized iron on faces of peds; slightly acid; 15 percent fine light gray (10YR 7/2) pockets of ash; abrupt wavy boundary.

Bg1—10 to 18 inches; grayish brown (10YR 5/2) ashy silt loam, light gray (10YR 7/2) dry; moderate medium subangular blocky structure; soft, friable, nonsticky and nonplastic; moderately fluid; common very fine and fine roots; many very fine and fine irregular pores; 5 percent dark brown (10YR 3/3) organic stains; 5 percent fine distinct dark yellowish brown (10YR 4/6) masses of oxidized iron on faces of peds; neutral; gradual wavy boundary.

Bg2—18 to 23 inches; grayish brown (10YR 5/2) ashy silt loam, light gray (2.5Y 7/2) dry; weak medium subangular blocky structure; soft, friable, nonsticky and nonplastic; moderately fluid; few fine roots; common very fine and fine irregular pores; organic stains that are dark brown (10YR 3/3) moist; 10 percent fine distinct dark yellowish brown (10YR 4/6) masses of oxidized iron on faces of peds; neutral; clear wavy boundary.

Cg1—23 to 40 inches; grayish brown (10YR 5/2) ashy silt loam, light gray (2.5Y 7/2) dry; 20 percent medium distinct yellowish brown (10YR 5/4) mottles; massive; soft, very friable, nonsticky and nonplastic; moderately fluid; few fine roots; few very fine irregular pores; 2 percent very dark grayish brown (10YR 3/2) organic stains; 15 percent fine prominent strong brown (7.5YR 4/6) masses of oxidized iron in matrix; neutral; mottles consisting of platy laminations between layers; gradual wavy boundary.

Cg2—40 to 52 inches; light brownish gray (2.5Y 6/2) ashy silt loam, white (2.5Y 8/1) dry; 15 percent medium prominent yellowish brown (10YR 5/4) mottles; massive; soft, very friable, nonsticky and nonplastic; moderately fluid; few very fine roots; few very fine irregular pores; 15 percent fine prominent strong brown (7.5YR 4/6) masses of oxidized iron in matrix; neutral; mottles consisting of platy laminations between layers; gradual wavy boundary.

Cg3—52 to 60 inches; light brownish gray (2.5Y 6/2) ashy silt loam, white (2.5Y 8/1) dry; 10 percent medium prominent yellowish brown (10YR 5/4) mottles; massive; soft, very friable, nonsticky and nonplastic; moderately fluid; few very fine roots; few very fine irregular pores; 20 percent fine prominent strong brown (7.5YR 4/6) masses of oxidized iron in matrix; slightly acid; mottles consisting of platy laminations between layers.

Typical Pedon Location

Map unit in which located: Hoodoo ashy silt loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 2 miles north of Moab, Washington; about 2,470 feet east and 935 feet south of the northwest corner of section 14, T. 26 N., R. 45 E.

Range in Characteristics

Profile

Thickness of umbric epipedon—10 to 15 inches

Thickness of loess influence—10 to 20 inches

Depth to apparent water table—soil surface to a depth of 18 inches in January through May, more than 18 inches in June through December
Depth to redoximorphic features—10 to 20 inches

A horizon
Hue—10YR, 2.5Y
Value—2 or 3 moist, 4 or 5 dry
Chroma—1 or 2 moist or dry
Clay content—6 to 12 percent
Reaction—moderately acid, slightly acid

Bg horizon
Hue—10YR, 2.5Y
Value—4 to 7 moist, 6 to 8 dry
Chroma—1 or 2 moist or dry
Texture—ashy very fine sandy loam, ashy silt loam
Clay content—4 to 10 percent
Reaction—slightly acid, neutral

Cg horizon
Hue—10YR, 2.5Y
Value—5 to 7 moist, 6 to 8 dry
Chroma—1 or 2 moist or dry
Texture—ashy very fine sandy loam, ashy silt loam
Clay content—4 to 8 percent
Reaction—slightly acid, neutral

Huckle Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes and shoulders of mountains
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from siltite and fine-grained quartzite
Slope range: 35 to 65 percent
Elevation: 2,810 to 4,300 feet
Average annual precipitation: 28 to 35 inches
Average annual air temperature: 42 to 46 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Ashy over loamy-skeletal, amorphic over isotic, frigid Typic Udivitrands

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 2 inches; slightly decomposed needles, leaves, twigs, cones, and bark.
Oe—2 to 3 inches; decomposed organic matter mixed with 1980's Mount St. Helens volcanic ash.
A—3 to 4 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak very fine and fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine and common medium tubular pores; 10 percent gravel; neutral; abrupt wavy boundary.
Bw1—4 to 8 inches; yellowish brown (10YR 5/4) ashy silt loam, dark yellowish brown (10YR 3/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and common medium

and coarse roots; many very fine and fine and common medium tubular pores; 10 percent gravel; neutral; gradual wavy boundary.

Bw2—8 to 13 inches; light yellowish brown (10YR 6/4) ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine and common medium tubular pores; 10 percent gravel; neutral; gradual wavy boundary.

Bw3—13 to 19 inches; light yellowish brown (10YR 6/4) gravelly ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine and common medium tubular pores; 15 percent gravel; slightly acid; abrupt wavy boundary.

2Bw4—19 to 28 inches; pale brown (10YR 6/3) very cobbly silt loam, brown (10YR 4/3) moist; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine and few medium and coarse tubular pores; 15 percent gravel and 35 percent cobbles; neutral; clear wavy boundary.

2BC—28 to 38 inches; very pale brown (10YR 8/4) extremely cobbly silt loam, light yellowish brown (10YR 6/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium and coarse tubular pores; 20 percent gravel, 40 percent cobbles, and 3 percent fine paragravel; slightly acid; gradual wavy boundary.

2C—38 to 47 inches; yellow (10YR 8/6) extremely cobbly loam, brownish yellow (10YR 6/6) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine and few medium and coarse tubular pores; 20 percent gravel, 40 percent cobbles, 5 percent stones, and 10 percent fine paragravel; slightly acid; clear wavy boundary.

2Cr—47 inches; weathered, fractured siltite.

Typical Pedon Location

Map unit in which located: Ardenvoir-Huckle association, 35 to 65 percent slopes

Location in survey area: Benewah County, Idaho, about 4.5 miles southeast of Plummer; about 1,650 feet north and 1,750 feet west of the southeast corner of section 26, T. 46 N., R. 4 W.

Range in Characteristics

Profile

Depth to bedrock—40 to 60 inches (paralithic)
Thickness of volcanic ash mantle—14 to 24 inches

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam
Clay content—5 to 10 percent
Gravel content—0 to 20 percent
Reaction—slightly acid, neutral

Bw horizon

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist

Texture—ashy silt loam
Clay content—5 to 10 percent
Gravel content—0 to 20 percent
Reaction—slightly acid, neutral

2Bw horizon
Hue—10YR, 7.5YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, loam
Clay content—5 to 15 percent
Gravel content—15 to 40 percent
Cobble content—0 to 50 percent
Total rock fragment content—35 to 60 percent
Reaction—moderately acid to neutral

2BC horizon (where present)
Hue—10YR, 7.5YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, loam, fine sandy loam
Clay content—5 to 15 percent
Gravel content—15 to 40 percent
Cobble content—5 to 45 percent
Paragravel content—0 to 5 percent
Total rock fragment content—35 to 75 percent
Reaction—moderately acid, slightly acid

2C horizon
Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 to 6 dry or moist
Texture—loam, silt loam, fine sandy loam
Clay content—5 to 15 percent
Gravel content—10 to 30 percent
Cobble content—15 to 50 percent
Stone content—0 to 10 percent
Paragravel content—0 to 10 percent
Total rock fragment content—40 to 80 percent
Reaction—moderately acid, slightly acid

Hunters Taxadjunct

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads on relict glacial lake terraces
Parent material: Loess mixed with a minor amount of volcanic ash over calcareous glaciolacustrine deposits
Slope range: 0 to 8 percent
Elevation: 1,800 to 1,900 feet
Average annual precipitation: 18 to 20 inches
Average annual air temperature: 46 to 48 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Coarse-silty, mixed, superactive, mesic Vitrandic Haploxerolls

Taxadjunct Features

The Hunters soils in this survey area are a taxadjunct to the series because the particle-size control section is coarse-silty. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 6 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, friable, nonsticky and slightly plastic; common very fine and fine roots; many fine tubular pores and many very fine interstitial pores; moderately acid; clear smooth boundary.

A—6 to 14 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, friable, nonsticky and slightly plastic; few very fine and fine roots; common very fine interstitial and dendritic tubular pores; slightly acid; abrupt smooth boundary.

Bw—14 to 26 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; neutral; gradual smooth boundary.

Bk1—26 to 36 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium angular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; very slightly effervescent; neutral; clear smooth boundary.

Bk2—36 to 46 inches; light yellowish brown (2.5Y 6/3) silt, olive brown (2.5Y 4/3) moist; weak medium angular blocky structure parting to moderate thin platy; slightly hard, friable, nonsticky and slightly plastic; plates very slightly brittle; few very fine roots; few very fine tubular pores; 25 percent discontinuous distinct pale yellow (2.5Y 8/2) carbonate coatings on lower surface of peds; very slightly effervescent; slightly alkaline; clear smooth boundary.

Bk3—46 to 55 inches; pale yellow (2.5Y 7/3) silt, light olive brown (2.5Y 5/3) moist; strong thick platy structure; slightly hard, friable, nonsticky and slightly plastic; plates very slightly brittle; few very fine roots in cracks; few very fine interstitial pores; 50 percent discontinuous distinct pale yellow (2.5Y 8/2) carbonate coatings on lower surface of peds; strongly effervescent; moderately alkaline; clear wavy boundary.

Bk4—55 to 64 inches; pale yellow (2.5Y 8/2) silt, light brownish gray (2.5Y 6/2) moist; strong thick platy structure parting to moderate thin platy; slightly hard, friable, nonsticky and slightly plastic; plates very slightly brittle; few very fine interstitial pores; 10 percent discontinuous distinct white (2.5Y 8/1) carbonate coatings on lower surface of peds; violently effervescent; moderately alkaline.

Typical Pedon Location

Map unit in which located: Hunters ashy silt loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 0.2 mile south of State Route 206 on Feryn's Farm road; about 790 feet east and 975 feet south of the northwest corner of section 5, T. 26 N., R. 44 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 18 inches

Thickness of loess and volcanic ash influence—7 to 18 inches

Depth to secondary calcium carbonates—18 to 34 inches

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Reaction—moderately acid, slightly acid

Bw horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 to 4 moist or dry
Reaction—slightly acid, neutral

Bk horizon
Hue—10YR, 2.5Y
Value—5 to 8 dry, 4 to 6 moist
Chroma—2 to 4 dry or moist
Texture—silt, silt loam, very fine sandy loam
Gravel—0 to 5 percent
Reaction—neutral to moderately alkaline

Hysing Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes, footslopes, and summits of mountains and hills
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and quartz-monzonite
Slope range: 3 to 55 percent
Elevation: 2,200 to 4,600 feet
Average annual precipitation: 25 to 42 inches
Average annual air temperature: 41 to 45 degrees F
Frost-free period: 60 to 110 days

Taxonomic class: Ashy over sandy or sandy-skeletal, amorphic over isotic, frigid Typic Udivitrands

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 1 inch; slightly decomposed needles, leaves, twigs, and cones.
Oe—1 to 2 inches; moderately decomposed plant material mixed with 1980's Mount St. Helens volcanic ash.
A—2 to 6 inches; dark brown (10YR 3/3) ashy silt loam, brown (10YR 5/3) dry; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine, fine, and medium roots; many fine tubular pores and many very fine irregular pores; neutral; clear wavy boundary.
Bw1—6 to 18 inches; dark yellowish brown (10YR 4/4) ashy silt loam, brown (10YR 6/4) dry; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; many fine tubular pores and many very fine irregular pores; slightly acid; clear wavy boundary.
Bw2—18 to 28 inches; yellowish brown (10YR 5/4) ashy silt loam, very pale brown (10YR 7/4) dry; weak medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; many fine tubular pores and many very fine irregular pores; neutral; abrupt irregular boundary.
2BC—28 to 31 inches; light olive brown (2.5Y 5/3) very gravelly sandy loam, pale yellow (2.5Y 7/3) dry; weak fine subangular blocky structure; slightly hard, friable,

nonsticky and nonplastic; common very fine, fine, and medium roots throughout; few medium irregular pores and common very fine dendritic tubular pores; 35 percent fine gravel; moderately acid; clear irregular boundary.

2C—31 to 47 inches; variegated very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 50 percent gravel; moderately acid; gradual wavy boundary.

2Cr—47 inches; weakly cemented quartz-monzonite; fractures less 4 inches apart; can be dug with spade with little difficulty; no roots.

Typical Pedon Location

Map unit in which located: Jacot-Hysing complex, 15 to 30 percent slopes

Location in survey area: Spokane County, Washington, about 4.5 miles southeast of Mount Spokane, Washington; about 575 feet south and 2,160 feet east of the northwest corner of section 10, T. 27 N., R. 45 E.

Range in Characteristics

Profile

Depth to bedrock—40 to 60 inches (paralithic)
Depth to bedrock—more than 60 inches (lithic)
Thickness of volcanic ash mantle—14 to 27 inches

A horizon

Hue—10YR, 7.5YR
Value—2 or 3 moist, 4 or 5 dry
Chroma—2 to 4 moist or dry
Clay content—3 to 8 percent
Gravel content—0 to 5 percent
Reaction—slightly acid, neutral

Bw horizon

Hue—10YR, 7.5YR
Value—3 to 5 moist, 4 to 7 dry
Chroma—3 to 6 moist or dry
Texture—ashy silt loam, ashy fine sandy loam
Clay content—3 to 8 percent
Gravel content—0 to 10 percent
Reaction—moderately acid to neutral

2Bt and 2Bw horizons (where present)

Value—4 or 5 moist, 4 to 6 dry
Chroma—3 to 6 moist or dry
Texture—sandy loam, loamy sand
Clay content—8 to 14 percent
Fine gravel content—20 to 30 percent
Reaction—strongly acid, moderately acid
Other features in some pedons—thin weak lamellae; 0 to 5 percent clay bridging sand grains

2BC and 2C horizons

Hue—10YR, 2.5Y
Value—4 to 6 moist, 6 to 8 dry
Chroma—3 or 4 moist or dry
Texture—sandy loam, loamy sand, loamy coarse sand, coarse sand, sand
Clay content—2 to 5 percent
Gravel content—35 to 60 percent, dominantly fine gravel
Reaction—strongly acid to neutral

Jacot Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes, footslopes, and summits of mountains and hills
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and quartz-monzonite
Slope range: 3 to 55 percent
Elevation: 2,200 to 4,600 feet
Average annual precipitation: 25 to 42 inches
Average annual air temperature: 41 to 45 degrees F
Frost-free period: 60 to 120 days

Taxonomic class: Ashy over loamy, amorphic over isotic, frigid Alfic Udivitrands

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 1 inch; slightly decomposed plant material.
Oe—1 to 3 inches; moderately decomposed plant material.
A—3 to 10 inches; dark brown (7.5YR 3/4) ashy silt loam, brown (7.5YR 5/4) dry; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine, fine, and medium roots; many fine tubular pores and many very fine irregular pores; slightly acid; clear wavy boundary.
Bw—10 to 18 inches; brown (7.5YR 4/4) ashy silt loam, light brown (7.5YR 6/4) dry; weak medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine and few medium and coarse roots; many fine tubular pores and many very fine irregular pores; neutral; abrupt wavy boundary.
2Bt1—18 to 24 inches; dark yellowish brown (10YR 4/4) gravelly sandy loam, light yellowish brown (10YR 6/4) dry; weak medium and coarse subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine, fine, and coarse roots; common very fine and fine tubular pores; 15 percent discontinuous faint clay bridges between sand grains; 20 percent gravel; slightly acid; clear wavy boundary.
2Bt2—24 to 39 inches; light olive brown (2.5Y 5/3) gravelly sandy loam, pale yellow (2.5Y 7/3) dry; weak coarse subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine, fine, and medium roots; many fine interstitial pores; 5 percent patchy faint clay bridges between sand grains; two 2-millimeter-thick discontinuous wavy clay lamellae; 25 percent gravel; slightly acid; clear wavy boundary.
2BC—39 to 50 inches; yellowish brown (10YR 5/6) gravelly sandy loam, yellow (10YR 7/6) dry; weak coarse subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and medium roots; many fine interstitial pores; 15 percent gravel; slightly acid; clear wavy boundary.
2C1—50 to 59 inches; light olive brown (2.5Y 5/4) fine gravelly loamy sand, pale yellow (2.5Y 7/3) dry; massive; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; many very fine, fine, and medium interstitial pores; 25 percent fine gravel; slightly acid; clear wavy boundary.
2C2—59 to 62 inches; 30 percent yellowish brown (10YR 5/4), 30 percent light olive brown (2.5Y 5/3), and 40 percent light brownish gray (2.5Y 6/2) fine gravelly loamy sand, very pale brown (10YR 7/4) and pale yellow (2.5Y 7/3 and 8/2) dry; massive; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; many very fine, fine, and medium interstitial pores; 30 percent fine gravel; slightly acid.

Typical Pedon Location

Map unit in which located: Jacot-Hysing complex, 30 to 55 percent slopes
Location in survey area: Spokane County, Washington, about 4.5 miles southeast of Mount Spokane; about 0.5 mile south of Hysing Spring, on IEP logging road; about 2,015 feet east and 1,010 feet south of the northwest corner of section 13, T. 27 N., R. 45 E.

Range in Characteristics

Profile
Depth to bedrock—more than 60 inches
Thickness of volcanic ash mantle—14 to 20 inches

A horizon
Hue—10YR, 7.5YR
Value—3 to 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Clay content—3 to 8 percent
Gravel—0 to 10 percent
Bulk density—0.65 to 0.85 grams per cubic centimeter
Reaction—moderately acid to neutral

Bw horizon
Hue—7.5YR, 10YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—4 or 6 dry or moist
Texture—ashy silt loam, ashy fine sandy loam
Clay content—3 to 8 percent
Gravel content—0 to 10 percent
Reaction—moderately acid to neutral

2Bt horizon
Hue—10YR, 2.5Y, 7.5YR
Value—5 to 7 dry, 4 to 6 moist
Chroma—3 to 6 dry, 3 or 4 moist
Texture—sandy loam, fine sandy loam
Clay content—8 to 15 percent
Gravel content—5 to 30 percent
Reaction—moderately acid, slightly acid

2BC horizon
Hue—10YR, 2.5Y
Value—5 to 8 dry, 4 to 6 moist
Chroma—3 to 6 dry or moist
Texture—sandy loam, loamy sand
Clay content—3 to 5 percent
Gravel content—15 to 30 percent
Reaction—strongly acid to slightly acid

2C horizon
Hue—10YR, 2.5Y
Value—7 or 8 dry, 5 or 6 moist
Chroma—2 to 6 dry or moist
Textures—loamy sand, loamy coarse sand
Clay content—3 to 5 percent

Gravel content—25 to 55 percent
Reaction—strongly acid to slightly acid

Kaniksu Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers on outwash plains
Parent material: Sandy glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 25 percent
Elevation: 1,900 to 2,600 feet
Average annual precipitation: 20 to 30 inches
Average annual air temperature: 42 to 49 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Sandy, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed leaves, needles, twigs, and bark.
A—1 to 6 inches; brown (10YR 5/3) ashy sandy loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine and few medium roots; common very fine irregular and tubular pores; slightly acid; abrupt wavy boundary.
Bw—6 to 15 inches; pale brown (10YR 6/3) ashy sandy loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine irregular and tubular pores; neutral; clear wavy boundary.
E and Bt1—15 to 25 inches; pale brown (10YR 6/3) loamy sand, dark yellowish brown (10YR 4/4) moist (E part); weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few 1/8-inch-thick continuous wavy bands of yellowish brown (10YR 5/4) loamy sand (Bt part), dark yellowish brown (10YR 4/4) moist; common very fine and fine and few coarse roots; many very fine irregular and tubular pores; slightly acid; gradual wavy boundary.
E and Bt2—25 to 43 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist (E part); weak coarse subangular blocky structure; soft, very friable, nonsticky and nonplastic; few 1/8-inch-thick discontinuous wavy bands of dark yellowish brown (10YR 5/4) loamy sand (Bt part), yellowish brown (10YR 4/4) moist; few very fine and fine roots; many very fine irregular pores; 5 percent rounded gravel; slightly acid; gradual wavy boundary.
E and Bt3—43 to 55 inches; very pale brown (10YR 7/3) loamy sand, dark yellowish brown (10YR 4/4) moist (E part); weak coarse subangular blocky structure; soft, very friable, nonsticky and nonplastic; common continuous 1/4-inch-thick wavy bands of yellowish brown (10YR 5/4) loamy sand (Bt part), dark yellowish brown (10YR 4/4) moist; few very fine and fine roots; many very fine interstitial pores; 1 percent rounded gravel; slightly acid; gradual wavy boundary.
C—55 to 70 inches; variegated sand; single grain; loose, nonsticky and nonplastic; many fine interstitial pores; neutral.

Typical Pedon Location

Map unit in which located: Kaniksu ashy sandy loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 2 miles northeast of Chattaroy, Washington; about 2,400 feet south and 500 feet west of the northeast corner of section 25, T. 28 N., R. 43 E.

Range in Characteristics

Profile
Thickness of ochric epipedon—4 to 8 inches
Thickness of volcanic ash influence—7 to 20 inches
Depth to loamy sand or sand—12 to 24 inches
Combined thickness of lamellae 3/8 inch thick or more—less than 6 inches

A horizon
Value—4 or 5 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Clay content—4 to 8 percent
Gravel content—0 to 5 percent
Reaction—moderately acid, slightly acid

Bw horizon
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy fine sandy loam, sandy loam, fine sandy loam
Clay content—4 to 8 percent
Gravel content—0 to 5 percent
Reaction—slightly acid, neutral

E and Bt horizon
E part:
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, loamy sand, sand
Clay content—2 to 8 percent
Gravel content—0 to 10 percent
Reaction—slightly acid, neutral

Bt part:
Value—5 or 6 dry, 4 or 5 moist
Chroma—4 to 6 dry or moist

C horizon (where present)
Hue—10YR, 2.5Y, variegated
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy sand, sand
Clay content—0 to 5 percent
Gravel content—0 to 15 percent
Reaction—slightly acid, neutral

Keeler Taxadjunct

Depth class: Very deep
Drainage class: Well drained
Landform: Backslopes and summits of hills and mountains
Parent material: Loess with an influence of volcanic ash over colluvium and residuum derived from granite

Slope range: 8 to 60 percent
Elevation: 2,300 to 3,700 feet
Mean annual precipitation: 25 to 38 inches
Mean annual air temperature: 41 to 45 degrees F
Frost-free period: 80 to 120 days

Taxonomic class: Fine-loamy, isotic, frigid Vitrandic Hapludalfs

Taxadjunct Features

The Keeler soils in this survey area are a taxadjunct to the series because they are assumed to meet the criteria for isotic mineralogy. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material.
Oe—1 to 2 inches; moderately decomposed plant material.
A—2 to 4 inches; brown (10YR 5/3) fine gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine tubular and interstitial pores; 15 percent fine subrounded granite gravel; slightly acid; trace amount of very fine mica flakes; clear smooth boundary.
BA—4 to 9 inches; pale brown (10YR 6/3) fine gravelly ashy loam, dark yellowish brown (10YR 3/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine tubular pores; 20 percent fine subrounded granite gravel; slightly acid; trace amount of very fine mica flakes; clear wavy boundary.
BtE—9 to 16 inches; very pale brown (10YR 7/3) fine gravelly loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine tubular pores; 2 percent faint clay films on faces of peds; 25 percent fine subrounded granite gravel; strongly acid; trace amount of very fine mica flakes; clear wavy boundary.
Bt—16 to 30 inches; very pale brown (10YR 7/4) fine gravelly sandy loam, yellowish brown (10YR 5/4) moist; moderate fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; common very fine tubular pores and common fine interstitial pores; 2 percent distinct clay films on faces of peds and 10 percent faint clay films on faces of peds; 30 percent fine subrounded granite gravel; strongly acid; 5 percent very fine and fine mica flakes; abrupt irregular boundary.
Bt/E—30 to 50 inches; very pale brown (10YR 7/4) fine gravelly sandy clay loam, yellowish brown (10YR 5/4) moist (Bt part); very pale brown (10YR 8/3) fine gravelly sandy clay loam, brown (10YR 5/3) moist (E part); moderate fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few fine tubular pores and many very fine and fine interstitial pores; 5 percent distinct clay films on faces of peds and 10 percent faint clay films on faces of peds; 30 percent fine subrounded granite gravel; moderately acid; 5 percent very fine and fine mica flakes; gradual wavy boundary.
BCt—50 to 60 inches; mixed yellow (10YR 7/6) and very pale brown (10YR 7/4) very gravelly coarse sandy loam, yellowish brown (10YR 5/6 and 10YR 5/4) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky

and slightly plastic; few very fine roots; many very fine and fine interstitial pores; 50 percent fine subrounded granite gravel; moderately acid; 2- to 3-millimeter-thick strong brown (7.5YR 4/6) lamellae; 5 percent fine and medium mica flakes.

Typical Pedon Location

Map unit in which located: Keeler-Kruse complex, 30 to 60 percent slopes
Location in survey area: Spokane County, Washington, about 6 miles east of Milan, Washington; about 435 feet west and 880 feet north of the southeast corner of section 30, T. 29 N., R. 45 E.

Range in Characteristics

Profile
Thickness of volcanic ash influence—7 to 10 inches
Volcanic glass content—5 to 20 percent
Reaction—strongly acid to slightly acid

A horizon
Value—4 to 6 dry, 2 to 4 moist
Chroma—2 to 4 dry or moist
Texture—ashy loam
Clay content—8 to 12 percent
Fine gravel content—5 to 20 percent

BA horizon, and Bw horizon (where present)
Value—3 to 6 dry, 2 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy loam
Clay content—10 to 14 percent
Fine gravel content—5 to 25 percent

BtE horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 or 3 dry or moist
Texture—loam, sandy loam
Clay content—15 to 20 percent
Fine gravel content—10 to 30 percent

Bt horizon
Hue—10YR, 7.5YR
Value—5 to 7 dry, 4 to 6 moist
Chroma—4 to 6 dry or moist
Texture—sandy loam, sandy clay loam
Clay content—18 to 23 percent
Fine gravel content—10 to 30 percent

Bt/E horizon (where present)
Value—5 to 8 dry, 4 to 7 moist
Chroma—3 to 6 dry or moist
Texture—sandy loam, sandy clay loam
Clay content—18 to 25 percent
Fine gravel content—15 to 30 percent

BCt horizon
Texture—coarse sandy loam, sandy loam
Clay content—10 to 18 percent
Fine gravel content—15 to 55 percent

Kellerbutte Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes of mountains and hills
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and gneiss
Slope range: 15 to 60 percent
Elevation: 2,200 to 5,000 feet
Average annual precipitation: 25 to 42 inches
Average annual air temperature: 42 to 46 degrees F
Frost-free period: 80 to 120 days

Taxonomic class: Ashy over loamy-skeletal, glassy over isotic, frigid Typic Vitrixerands

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, leaves, and twigs.
Oe—1 to 2 inches; moderately decomposed organic matter mixed with 1980's Mount St. Helens volcanic ash.
A—2 to 5 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular and tubular pores; 10 percent gravel; neutral; clear wavy boundary.
Bw1—5 to 11 inches; yellowish brown (10YR 5/4) ashy silt loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and few medium roots; many very fine and fine tubular and irregular pores; 10 percent gravel; slightly acid; gradual wavy boundary.
Bw2—11 to 17 inches; pale brown (10YR 6/3) gravelly ashy silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine irregular pores and common fine tubular pores; 20 percent gravel and 5 percent cobbles; slightly acid; abrupt wavy boundary.
2Bw3—17 to 23 inches; very pale brown (10YR 7/3) very gravelly sandy loam, brown (10YR 5/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and few fine roots; common very fine and fine irregular pores; 35 percent gravel and 15 percent cobbles; moderately acid; clear wavy boundary.
2BC—23 to 45 inches; very pale brown (10YR 7/3) very cobbly sandy loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few very fine roots; common very fine and fine irregular pores; 25 percent gravel and 25 percent cobbles; moderately acid; gradual wavy boundary.
2C—45 to 63 inches; very pale brown (10YR 7/3) extremely cobbly loamy sand, brown (10YR 5/3) moist; massive; soft, friable, nonsticky and nonplastic; few very fine roots; many very fine interstitial pores; 25 percent gravel and 40 percent cobbles; moderately acid; clear wavy boundary.
2R—63 inches; unweathered quartz-monzonite.

Typical Pedon Location

Map unit in which located: Kellerbutte-Brevco complex, 15 to 30 percent slopes
Location in survey area: Spokane County, Washington, about 1.2 miles east of Madison Branch Road, about 1,800 feet west and 2,100 feet south of the northeast corner of section 2, T. 27 N., R. 44 E.

Range in Characteristics

Profile
Depth to bedrock—60 to 80 inches (lithic)
Thickness of volcanic ash mantle—14 to 20 inches

A horizon
Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—3 to 4 dry or moist
Clay content—4 to 8 percent
Gravel content—0 to 10 percent
Reaction—slightly acid, neutral

Bw horizon
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy silt loam, ashy sandy loam
Clay content—4 to 8 percent
Gravel content—10 to 20 percent
Cobble content—0 to 5 percent
Total rock fragment content—10 to 25 percent
Reaction—slightly acid, neutral

2Bw horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam
Clay content—6 to 10 percent
Gravel content—25 to 40 percent
Cobble content—10 to 20 percent
Total rock fragment content—35 to 60 percent
Reaction—moderately acid, slightly acid

2BC horizon
Absent in some pedons

2C horizon
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Texture—loamy sand, loamy coarse sand
Clay content—2 to 5 percent
Gravel content—25 to 55 percent
Cobble content—15 to 40 percent
Total rock fragment content—50 to 75 percent
Reaction—moderately acid, slightly acid

Klickson Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes of basalt plateaus, earthflows, canyons, escarpments
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 15 to 80 percent

Elevation: 1,650 to 2,600 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 42 to 50 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Loamy-skeletal, isotic, frigid Vitrandic Argixerolls (fig. 27)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 2 inches; slightly decomposed moss, twigs, needles, and leaves.
Oe—2 to 3 inches; moderately decomposed organic material mixed with 1980's Mount St. Helens volcanic ash.
A1—3 to 8 inches; dark grayish brown (10YR 4/2) gravelly ashy silt loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; many very fine and fine and common medium and coarse roots; many fine irregular pores and many very fine tubular pores; 15 percent gravel; slightly acid; clear wavy boundary.

Figure 27.—Typical profile of a Klickson soil.

A2—8 to 12 inches; grayish brown (10YR 5/2) gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine and fine and few medium and coarse roots; common fine irregular pores and common very fine tubular pores; 20 percent gravel; slightly acid; clear wavy boundary.

BA—12 to 17 inches; brown (10YR 5/3) gravelly ashy loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common fine irregular pores and common very fine tubular pores; 5 percent clay bridges between sand grains; 25 percent gravel and 5 percent cobbles; moderately acid; clear wavy boundary.

Bt1—17 to 28 inches; pale brown (10YR 6/3) very cobbly loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine and fine tubular pores; 30 percent distinct clay films on faces of peds; 20 percent gravel and 20 percent cobbles; moderately acid; clear wavy boundary.

Bt2—28 to 35 inches; pale brown (10YR 6/3) very stony loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few very fine and fine tubular pores; 20 percent distinct clay films on faces of peds; 20 percent gravel, 10 percent cobbles, and 20 percent stones; moderately acid; clear wavy boundary.

Bt3—35 to 50 inches; light yellowish brown (10YR 6/4) extremely stony loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; 10 percent faint clay films on faces of peds; 15 percent gravel, 10 percent cobbles, and 50 percent stones; moderately acid; gradual wavy boundary.

BC—50 to 60 inches; light yellowish brown (10YR 6/4) extremely cobbly loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few very fine irregular pores; 20 percent gravel, 40 percent cobbles, and 20 percent stones; moderately acid.

Typical Pedon Location

Map unit in which located: Klickson-Speigle complex, mass wasted, 15 to 30 percent slopes

Location in survey area: Spokane County, Washington, about 1 mile northwest of Mica, Washington; about 2,058 feet north and 2,880 feet east of the southwest corner of section 15, T. 24 N., R. 44 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—10 to 20 inches

A horizon

Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—10 to 15 percent
Gravel content—15 to 20 percent
Cobble content—0 to 10 percent

Total rock fragment content—15 to 30 percent
Reaction—slightly acid, neutral

BA horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—12 to 16 percent
Gravel content—10 to 30 percent
Cobble content—0 to 10 percent
Total rock fragment content—15 to 30 percent
Reaction—moderately acid to neutral

Bt horizon
Value—4 to 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—loam
Clay content—18 to 24 percent
Gravel content—15 to 40 percent
Cobble content—10 to 40 percent
Stone content—0 to 5 percent in upper part, 20 to 50 percent in lower part
Total rock fragment content—40 to 75 percent
Reaction—moderately acid, slightly acid

BC horizon
Value—4 to 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—loam
Clay content—12 to 20 percent
Gravel content—20 to 35 percent
Cobble content—40 to 55 percent
Stone content—10 to 30 percent
Total rock fragment content—70 to 90 percent
Reaction—moderately acid, slightly acid

A C horizon is in some pedons.

Kramerhill Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Summits, footslopes, and backslopes of hills and mountains
Parent material: Colluvium and residuum derived from saprolitic gneiss, quartzite, and Latah Formation mixed with loess and volcanic ash in the upper part
Slope range: 3 to 40 percent
Elevation: 1,900 to 3,200 feet
Average annual precipitation: 15 to 25 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-loamy, isotic, mesic Vitrandic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, twigs, and moss.

A1—1 to 5 inches; yellowish brown (10YR 5/4) ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine and medium roots; many very fine and fine irregular and tubular pores; 10 percent gravel; slightly acid; clear wavy boundary.

A2—5 to 9 inches; brown (10YR 5/3) ashy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 10 percent gravel; neutral; abrupt wavy boundary.

BE—9 to 19 inches; light yellowish brown (10YR 6/4) gravelly loam, yellowish brown (10YR 5/4) moist; weak fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few fine and common very fine roots; common very fine tubular pores; 15 percent distinct clay films on faces of peds; 20 percent gravel; slightly acid; clear wavy boundary.

Bt1—19 to 30 inches; brown (7.5YR 5/4) gravelly sandy clay loam, brown (7.5YR 4/4) moist; moderate fine and medium subangular blocky structure; very hard, very firm, slightly sticky and slightly plastic; few very fine and fine roots; few fine and common very fine tubular pores; 50 percent distinct clay films on faces of peds; 5 percent fine mica flakes; 20 percent gravel; slightly acid; gradual wavy boundary.

Bt2—30 to 46 inches; strong brown (7.5YR 5/6) gravelly sandy clay loam, strong brown (7.5YR 4/6) moist; moderate medium subangular blocky structure; very firm, very hard, slightly sticky and slightly plastic; few very fine roots; few fine and common very fine tubular pores; 50 percent distinct clay films on faces of peds; 5 percent fine mica flakes; 25 percent gravel; slightly acid; gradual wavy boundary.

Cr—46 inches; highly weathered and moderately weathered saprolitic gneiss; 30 percent discontinuous clay films in cracks.

Typical Pedon Location

Map unit in which located: Kramerhill-Uhlig-Skalan complex, 8 to 25 percent slopes

Location in survey area: Spokane County, Washington, about 1.5 miles south of Liberty Lake, Washington; about 185 feet north and 2,275 feet east of the southwest corner of section 35, T. 25 N., R. 45 E.

Range in Characteristics

Profile

Depth to bedrock—40 to 60 inches (paralithic)
Thickness of volcanic ash influence—7 to 14 inches

A horizon

Value—4 to 6 dry, 2 to 4 moist
Chroma—1 to 4 dry or moist
Clay content—10 to 16 percent
Gravel content—0 to 10 percent
Cobble content—0 to 5 percent
Total rock fragment content—0 to 15 percent
Reaction—slightly acid, neutral

A Bw horizon is in some pedons.

BE horizon

Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Texture—loam, silt loam

Clay content—12 to 18 percent
Gravel content—5 to 20 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 25 percent
Reaction—slightly acid, neutral

Bt horizon
Hue—10YR, 7.5YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Texture—sandy clay loam, loam, clay loam
Clay content—20 to 34 percent
Gravel content—10 to 30 percent
Cobble content—0 to 5 percent
Total rock fragment content—10 to 35 percent
Reaction—moderately acid to neutral

A BC or C horizon is in some pedons.

Kronquist Series

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Flood plains, drainageways, stream terraces
Parent material: Alluvium mixed with loess and volcanic ash in the upper part
Slope range: 0 to 3 percent
Elevation: 1,600 to 2,400 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 42 to 46 degrees F
Frost-free period: 80 to 110 days

Taxonomic class: Fine-loamy, isotic, frigid Aquandic Endoaqualfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 11 inches; dark gray (10YR 4/1) ashy silt loam, black (10YR 2/1) moist; moderate fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; common fine roots; many very fine irregular and tubular pores; neutral; abrupt smooth boundary.

BAt—11 to 27 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; strong medium prismatic structure parting to strong very fine angular blocky; very hard, firm, moderately sticky and moderately plastic; common fine roots; many very fine irregular and tubular pores; common faint clay films in pores and on some faces of peds; few very fine black stains in pores; 15 percent fine gray (10YR 5/1) iron depletions, very dark gray (10YR 3/1) moist; 2 percent fine distinct yellowish brown (10YR 5/6) masses of iron and manganese accumulation; neutral; clear smooth boundary.

Btg1—27 to 40 inches; grayish brown (10YR 5/2) clay loam, very dark grayish brown (10YR 3/2) moist; strong fine prismatic structure parting to strong fine angular blocky; very hard, firm, moderately sticky and moderately plastic; few fine roots; many very fine and common fine pores; common faint and distinct slightly darker clay films on surface of peds and continuous clay films in tubular pores and some adjacent irregular pores; 2 percent fine distinct masses of iron and manganese accumulation that are dark brown (7.5YR 4/4) moist; neutral; clear wavy boundary.

Btg2—40 to 55 inches; grayish brown (10YR 5/2) clay loam, dark brown (10YR 3/3) moist; weak medium prismatic structure parting to weak medium angular blocky; very hard, firm, moderately sticky and moderately plastic; few fine roots; common fine and many very fine irregular and interstitial pores; common clay films on faces of peds and continuous clay films in tubular pores and some adjacent irregular pores; 2 percent fine faint masses of iron and manganese accumulation that are dark brown (7.5YR 4/4) moist; neutral; abrupt wavy boundary.

BCtg—55 to 60 inches; light brownish gray (10YR 6/2) sandy clay loam, dark grayish brown (10YR 4/2) moist; massive; very hard, firm, moderately sticky and moderately plastic; few fine roots; common very fine and fine pores; few faint clay films in pores; 2 percent fine faint masses of iron and manganese accumulation that are dark brown (7.5YR 4/4) moist; neutral.

Typical Pedon Location

Map unit in which located: Hoodoo-Kronquist complex, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 1.75 miles southeast of the junction of Forker Road and State Route 206; about 2,079 feet south and 819 feet west of the northeast corner of section 2, T. 26 N., R. 44 E.

Range in Characteristics

Profile

Thickness of umbric epipedon—more than 20 inches
Thickness of volcanic ash influence—20 to 30 inches
Clay content in particle-size control section—27 to 34 percent
Depth to apparent water table—10 to 20 inches in February through May, more than 10 inches in June through January
Depth to redoximorphic features—10 to 20 inches
Redoximorphic concentrations—distinct or prominent in lower part of umbric epipedon
Reaction—slightly acid or neutral

A horizon

Hue—10YR, 2.5Y
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 or 2 moist or dry
Clay content—12 to 18 percent

BAt horizon

Hue—10YR, 2.5Y
Value—4 or 5 dry, 2 or 3 moist
Chroma—0 to 2 moist or dry
Clay content—16 to 22 percent

Btg horizon

Hue—10YR, 2.5Y, neutral
Value—4 or 5 dry, 2 to 3 moist
Chroma—commonly 0 to 2 moist or dry, but ranges to 3 moist or dry in Btg2 horizon
Texture—silty clay loam, clay loam
Clay content—27 to 34 percent

BCtg horizon

Hue—10YR, 2.5Y, neutral
Value—5 or 6 dry, 3 or 4 moist
Chroma—0 to 2 moist or dry
Texture—sandy clay loam, clay loam
Clay content—27 to 34 percent
Gravel content—0 to 10 percent

Kruse Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes, summits, and footslopes of mountains and hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite, gneiss, and schist
Slope range: 8 to 60 percent
Elevation: 2,000 to 3,600 feet
Average annual precipitation: 25 to 38 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 80 to 120 days

Taxonomic class: Fine-loamy, isotic, frigid Vitrandic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material.
Oe—1 to 2 inches; moderately decomposed plant material.
A—2 to 10 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; many fine, medium, and coarse roots; many fine tubular pores and many very fine irregular pores; 5 percent fine gravel; neutral; 1 percent very fine mica flakes; clear wavy boundary.
BA—10 to 15 inches; pale brown (10YR 6/3) ashy sandy loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine and medium and few coarse roots; many fine tubular pores and many very fine irregular pores; 5 percent fine gravel; neutral; 2 percent very fine mica flakes; clear wavy boundary.
Bt1—15 to 23 inches; very pale brown (10YR 7/3) gravelly sandy clay loam, brown (7.5YR 5/4) moist; moderate medium subangular blocky structure; hard, firm, slightly sticky and moderately plastic; few very fine, fine, and medium roots; common fine irregular pores and common very fine tubular pores; 5 percent distinct clay films along pores and 20 percent faint clay films on faces of peds; 15 percent gravel; slightly acid; 5 percent very fine mica flakes; gradual wavy boundary.
Bt2—23 to 32 inches; brown (7.5YR 5/4) gravelly sandy clay loam, strong brown (7.5YR 5/6) moist; moderate medium and coarse subangular blocky structure; very hard, very firm, slightly sticky and moderately plastic; few fine roots; many fine tubular pores and many very fine irregular pores; 50 percent prominent clay films on faces of peds; 25 percent gravel; moderately acid; 10 percent very fine mica flakes; gradual wavy boundary.
Bt3—32 to 46 inches; pink (7.5YR 7/4) gravelly sandy clay loam, strong brown (7.5YR 5/6) moist; moderate coarse subangular blocky structure; very firm, very hard, slightly sticky and moderately plastic; few very fine roots throughout; many fine irregular pores; 20 percent distinct clay films along pores; 20 percent gravel; moderately acid; 15 percent very fine mica flakes; clear wavy boundary.
BC—46 to 52 inches; pale yellow (2.5Y 8/2) gravelly sandy loam, light olive brown (2.5Y 5/3) moist; massive parting to weak coarse subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine roots; many fine irregular pores; 15 percent gravel; slightly acid; 10 percent very fine mica flakes;

two 1- to 3-millimeter-thick strong brown (7.5YR 5/6) wavy clay bands; gradual wavy boundary.

C—52 to 61 inches; pale yellow (2.5Y 8/2) gravelly sandy loam, light olive brown (2.5Y 5/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine roots; many fine irregular pores; 20 percent gravel; slightly acid; 10 percent very fine mica flakes.

Typical Pedon Location

Map unit in which located: Kruse ashy silt loam, 8 to 15 percent slopes

Location in survey area: Spokane County, Washington, east of fenceline on IEP property; about 2,545 feet west and 1,595 feet south of the northeast corner of section 28, T. 24 N., R. 45 E.

Range in Characteristics

Profile

Thickness of volcanic ash influence—7 to 14 inches

A horizon

Value—4 to 6 dry, 2 to 4 moist
Chroma—2 to 3 dry or moist
Clay content—5 to 15 percent
Gravel content—5 to 20 percent
Reaction—slightly acid, neutral

BA or Bw horizon

Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy loam, ashy sandy loam
Clay content—5 to 15 percent
Gravel content—5 to 20 percent
Reaction—slightly acid, neutral

Bt horizon

Hue—10YR, 7.5YR
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 to 6 dry or moist
Texture—loam, sandy clay loam, clay loam
Clay content—18 to 30 percent
Gravel content—5 to 25 percent
Reaction—moderately acid, slightly acid

BC horizon

Hue—2.5Y, 10YR, 7.5YR
Value—5 to 8 dry, 3 to 5 moist
Chroma—2 to 6 dry, 3 to 6 moist
Texture—sandy loam, loam, sandy clay loam
Clay content—10 to 30 percent
Gravel content—5 to 40 percent
Mica content—2 to 15 percent
Reaction—moderately acid, slightly acid

C horizon (where present)

Hue—10YR, 2.5Y
Value—6 to 8 dry, 5 to 7 moist
Chroma—2 to 4 dry or moist

Texture—sandy loam, coarse sandy loam
Clay content—5 to 12 percent
Gravel content—10 to 45 percent
Mica content—2 to 15 percent
Reaction—moderately acid, slightly acid

Lacy Series

Depth class: Shallow
Drainage class: Well drained
Position on landscape: Summits, shoulders, and backslopes of basalt plateaus and escarpments
Parent material: Loess over colluvium and residuum derived from basalt
Slope range: 0 to 8 percent
Elevation: 1,900 to 2,700 feet
Average annual precipitation: 18 to 23 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, mixed, superactive, mesic Lithic Ultic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 2 inches; brown (10YR 5/3) cobbly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; many very fine and fine tubular pores; 10 percent gravel, 20 percent cobbles, and 2 percent stones; neutral; clear wavy boundary.

AB—2 to 6 inches; brown (10YR 5/3) extremely cobbly loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; hard, firm, slightly sticky and moderately plastic; common very fine and fine and few medium roots; common very fine and fine tubular pores; 25 percent faint clay films on faces of peds; 15 percent gravel, 50 percent cobbles, and 5 percent stones; slightly acid; clear wavy boundary.

Bt—6 to 10 inches; yellowish brown (10YR 5/4) extremely cobbly loam, dark yellowish brown (10YR 3/4) moist; moderate fine subangular blocky structure; hard, firm, slightly sticky and moderately plastic; few fine, medium, and coarse roots; common very fine and fine tubular pores; 10 percent faint clay films on faces of peds; 15 percent gravel, 50 percent cobbles, and 10 percent stones; slightly acid; gradual wavy boundary.

BC—10 to 16 inches; yellowish brown (10YR 5/6) extremely stony loam, dark yellowish brown (10YR 3/6) moist; moderate fine subangular blocky structure; hard, firm, slightly sticky and moderately plastic; few fine, medium, and coarse roots; few very fine and fine irregular pores; 5 percent faint clay films on rock fragments; 10 percent gravel, 35 percent cobbles, and 40 percent stones; slightly acid; abrupt wavy boundary.

R—16 inches; unweathered basalt.

Typical Pedon Location

Map unit in which located: Bobbitt-Lacy complex, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 0.75 mile north of Valleyford, Washington; about 385 feet west and 1,065 feet south of the northeast corner of section 28, T. 24 N., R. 44 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—6 to 14 inches
Depth to bedrock—10 to 20 inches (lithic)
Reaction—slightly acid, neutral

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—15 to 20 percent
Gravel content—10 to 20 percent
Cobble content—10 to 25 percent
Stone content—0 to 5 percent
Total rock fragment content—15 to 30 percent

AB horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 dry, 2 or 3 moist
Texture—loam
Clay content—20 to 25 percent
Gravel content—10 to 20 percent
Cobble content—15 to 60 percent
Stone content—0 to 5 percent
Total rock fragment content—35 to 70 percent

Bt horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—3 or 4 dry, 2 to 4 moist
Texture—loam
Clay content—20 to 30 percent
Gravel content—10 to 20 percent
Cobble content—25 to 60 percent
Stone content—0 to 15 percent
Total rock fragment content—35 to 75 percent

BC horizon
Value—3 to 5 dry, 3 or 4 moist
Chroma—3 to 6 dry or moist
Texture—loam, clay loam
Clay content—20 to 30 percent
Gravel content—0 to 15 percent
Cobble content—30 to 75 percent
Stone content—0 to 40 percent
Total rock fragment content—65 to 85 percent

Lakespring Series

Depth class: Moderately deep
Drainage class: Moderately well drained
Position on landscape: Treads and risers on outwash terraces, relict glacial lake terraces, and outwash plains
Parent material: Loess mixed with a minor amount of volcanic ash over laminated Latah Formation, glaciolacustrine deposits, and landslide deposits
Slope range: 0 to 25 percent

Elevation: 1,800 to 2,600 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 45 to 52 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-loamy, mixed, superactive, mesic Vitrandic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 7 inches; brown (10YR 5/3) ashy loam, dark brown (10YR 3/3) moist; weak medium and thick platy structure; slightly hard, very friable, nonsticky and slightly plastic; common very fine and few fine roots; many very fine irregular pores and few fine tubular pores; 5 percent gravel; neutral; abrupt smooth boundary.

Bt1—7 to 21 inches; yellowish brown (10YR 5/4) loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; moderately hard, firm, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine irregular pores and few fine tubular pores; 2 percent faint clay films on faces of peds; 10 percent gravel; neutral; clear smooth boundary.

Bt2—21 to 34 inches; yellowish brown (10YR 5/4) gravelly loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine irregular pores and few fine tubular pores; 15 percent distinct clay films on faces of peds; 2 percent fine black (N 2.5/0) iron-manganese concretions; 15 percent gravel; neutral; abrupt irregular boundary.

2Cd1—34 to 39 inches; yellow (10YR 7/8) and brownish yellow (10YR 6/8) silty clay loam, dark yellowish brown (10YR 4/6) moist; massive laminated thick plates; rigid, moderately sticky and moderately plastic; few very fine roots; few very fine irregular pores; slightly acid; clear smooth boundary.

2Cd2—39 to 50 inches; pale yellow (2.5Y 8/2) and light gray (2.5Y 7/2) silt loam, light yellowish brown (2.5Y 6/4) and dark yellowish brown (10YR 4/4) moist; massive laminated very thick plates; extremely hard, very firm, moderately sticky and moderately plastic; few very fine roots; many very fine irregular pores; 2 percent fine black (N 2.5/0) iron-manganese concretions and 10 percent medium strong brown (7.5YR 5/6) masses of oxidized iron; neutral; gradual smooth boundary.

2Cd3—50 to 72 inches; white (5Y 8/1) silty clay loam, dark yellowish brown (10YR 4/4) and light reddish brown (2.5YR 6/3) moist; massive laminated thick plates; extremely hard, very firm, moderately sticky and moderately plastic; many very fine irregular pores; 1 percent fine black (N 2.5/0) iron-manganese concretions and 4 percent fine dark yellowish brown (10YR 4/6) masses of oxidized iron lining pores; neutral.

Typical Pedon Location

Map unit in which located: Lakespring-Brincken, moist, complex, 8 to 25 percent slopes

Location in survey area: Spokane County, Washington, about 1.5 miles southwest of Silver Hill; about 200 feet south and 2,400 feet east of the northwest corner of section 27, T. 24 N., R. 43 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—7 to 9 inches
Thickness of volcanic ash influence—7 to 14 inches
Depth to perched water table—21 to 34 inches in February through April

Depth to redoximorphic features—21 to 36 inches
Depth to densic layer—20 to 40 inches
Reaction—slightly acid, neutral

Ap horizon, or A horizon (where present)
Hue—10YR, 2.5Y
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Clay content—8 to 12 percent
Gravel content—0 to 10 percent

An E, Bw, or Btx horizon is in some pedons.

Bt horizon
Hue—10YR, 5Y
Value—5 to 8 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—loam
Clay content—18 to 25 percent
Gravel content—0 to 15 percent

2Cd horizon
Hue—10YR, 5Y
Value—5 to 8 dry, 4 to 7 moist
Chroma—1 to 8 dry or moist
Texture—silt loam, loam, clay loam, silty clay loam
Clay content—18 to 34 percent
Gravel content—0 to 10 percent

Lakestarr Series

Depth class: Deep to densic material
Drainage class: Moderately well drained
Position on landscape: Backslopes and footslopes of mountains and hills
Parent material: Thin mantle of volcanic ash and loess over colluvium derived from pre-Tertiary felsic gneiss, schist, and till
Slope range: 8 to 30 percent
Elevation: 2,350 to 3,100 feet
Average annual precipitation: 25 to 35 inches
Average annual air temperature: 41 to 45 degrees F
Frost-free period: 60 to 120 days

Taxonomic class: Fine-loamy, isotic, frigid Andic Hapludalfs

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 2 inches; slightly decomposed needles, leaves, and twigs mixed with a discontinuous accumulation of 1980's Mount St. Helens volcanic ash.
Oe—2 to 3 inches; moderately decomposed plant material.
A—3 to 10 inches; dark brown (7.5YR 3/4) ashy silt loam, brown (7.5YR 5/4) dry; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; weakly smeary; common very fine, fine, and medium roots; common fine tubular pores and common very fine irregular pores; slightly acid; clear wavy boundary.

Bw—10 to 15 inches; brown (7.5YR 4/4) ashy silt loam, light brown (7.5YR 6/4) dry; weak medium subangular blocky structure; friable, soft, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common fine tubular pores and common very fine irregular pores; slightly acid; abrupt wavy boundary.

2E/Bt—15 to 24 inches; 60 percent brown (7.5YR 4/3) silt loam, pink (7.5YR 7/3) dry (E part), and 40 percent brown (7.5YR 4/3) loam, light brown (7.5YR 6/3) dry (Bt part); moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular and irregular pores; 20 percent faint clay films on faces of peds; moderately acid; clear wavy boundary.

2Btc—24 to 39 inches; brown (10YR 5/3) loam, very pale brown (10YR 7/3) dry; moderate coarse angular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; few fine irregular pores and common very fine tubular pores; 30 percent distinct clay films on faces of peds; 2 percent fine spherical very strongly cemented iron-manganese concretions with sharp boundaries in matrix; moderately acid; abrupt wavy boundary.

2E/Btxc—39 to 47 inches; 60 percent yellowish brown (10YR 5/4) loam, very pale brown (10YR 7/3) dry (E part), and 40 percent brown (7.5YR 5/4) loam, light brown (7.5YR 6/4) dry (Btx part); strong coarse angular blocky structure; extremely hard, extremely firm, slightly sticky and slightly plastic; brittle; no roots; common very fine and fine irregular pores; 60 percent distinct clay films on vertical faces of peds; 2 percent fine spherical very strongly cemented iron-manganese concretions with sharp boundaries in matrix; approximately 40 percent of horizon is dense and brittle; moderately acid; clear wavy boundary.

3Cdc1—47 to 55 inches; mixed light brown (7.5YR 6/3) and brown (7.5YR 5/4) loam, pink (7.5YR 7/4 and 7/3) dry; massive; extremely hard, firm, slightly sticky and slightly plastic; no roots; common very fine and few fine and medium irregular pores; 2 percent fine spherical very strongly cemented iron-manganese concretions with sharp boundaries in matrix; 2 percent fine gravel; strongly acid; clear wavy boundary.

3Cdc2—55 to 65 inches; brown (7.5YR 5/4) sandy clay loam, pink (7.5YR 7/3) dry; massive; very hard, very firm, slightly sticky and moderately plastic; no roots; few fine and common very fine irregular pores; 2 percent fine spherical very strongly cemented iron-manganese concretions with sharp boundaries in matrix; 10 percent fine gravel; strongly acid.

Typical Pedon Location

Map unit in which located: Lakestarr-Santa complex, 15 to 30 percent slopes

Location in survey area: Spokane County, Washington, about 7 miles east of Freeman, Washington; about 110 feet south and 2,835 feet west of the northeast corner of section 1, T. 23 N., R. 45 E.

Range in Characteristics

Profile

Depth to densic layer—40 to 60 inches
Depth to 2E/Btxc horizon—27 to 44 inches
Thickness of volcanic ash mantle—7 to 14 inches
Depth to perched water table—15 to 40 inches in February through April
Depth to redoximorphic features—15 to 40 inches

A horizon

Hue—10YR, 7.5YR
Value—3 or 4 moist, 5 or 6 dry

Chroma—3 or 4 moist or dry
Clay content—5 to 8 percent
Gravel content—0 to 5 percent

Bw horizon
Hue—10YR, 7.5YR
Chroma—4 to 6 moist or dry
Texture—ashy silt loam, ashy loam
Clay content—8 to 12 percent
Gravel content—0 to 10 percent
Reaction—moderately acid to neutral

2E/Bt or 2Bt/E horizon
Value—4 or 5 moist, 6 or 7 dry
Chroma—3 or 4 moist or dry
Texture—loam, silt loam
Clay content—18 to 22 percent
Gravel content—0 to 10 percent

2Btc horizon
Value—6 or 7 dry
Chroma—3 or 4 moist or dry
Texture—loam, silt loam
Clay content—18 to 20 percent
Gravel content—0 to 5 percent
Reaction—very strongly acid to slightly acid

2E/Btxc or 2Bt/Exc horizon
Texture—loam, sandy clay loam
Clay content—20 to 30 percent
Gravel content—0 to 5 percent
Reaction—strongly acid to slightly acid

3Cdc horizon
Hue—7.5YR, 10YR
Texture—loam, sandy loam, sandy clay loam
Clay content—20 to 24 percent in upper part, 18 to 30 percent in lower part
Gravel content—2 to 10 percent in upper part, 10 to 20 percent in lower part
Reaction—very strongly acid to moderately acid

Lance Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits, shoulders, and side slopes of loess hills on basalt plateaus
Parent material: Recent loess over older loess
Slope range: 15 to 60 percent
Elevation: 2,200 to 2,750 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 48 to 52 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Calcic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 9 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; common fine roots; many very fine interstitial pores; 5 percent hard and brittle durinodes in lower part; violently effervescent; moderately alkaline; abrupt smooth boundary.

Bkq1—9 to 14 inches; light gray (10YR 7/2) weakly silica-cemented extremely parachannery silt loam, brown (10YR 5/3) moist; moderate medium platy structure; very hard, firm, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; about 75 percent 1/2-inch extremely hard and brittle durinodes and discontinuous 1/8-inch-thick lenses; violently effervescent with many very pale brown (10YR 8/2) lime coatings on durinodes and lenses and as threads in matrix; strongly alkaline; clear wavy boundary.

Bkq2—14 to 22 inches; light gray (10YR 7/2) very parachannery silt loam, dark brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; 50 percent 1/2-inch extremely hard brittle durinodes; noneffervescent matrix, many very pale brown (10YR 8/2) lime coatings on durinodes; strongly alkaline; clear wavy boundary.

Bkq3—22 to 40 inches; light brown (7.5YR 6/4) silt loam, dark brown (7.5YR 4/4) moist; moderate fine and medium angular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; common black (10YR 2/1) coatings on peds; common thin discontinuous silica films on peds and in pores; noneffervescent matrix, common very pale brown (10YR 8/2) lime in seams; strongly alkaline; clear wavy boundary.

Bkq4—40 to 60 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; massive; hard, firm, slightly sticky and slightly plastic; few very fine roots; few very fine tubular pores; few thin silica films in tubular pores and as bridges between sand grains; slightly effervescent, lime in seams and pores; strongly alkaline.

Typical Pedon Location

Map unit in which located: Athena-Lance complex, 15 to 30 percent slopes

Location in survey area: Spokane County, Washington, about 2,110 feet north and 450 feet east of the southwest corner of section 14, T. 23 N., R. 41 E.

Range in Characteristics

Profile

Clay content in particle-size control section—18 to 22 percent
Depth to Bkq horizon—6 to 12 inches
Depth to weak duripan (in some pedons)—below 40 inches
Texture—silt loam throughout

A horizon

Value—5 to 7 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Clay content—18 to 24 percent
Durinode content—0 to 15 percent; weakly cemented to strongly cemented

Bkq horizon

Hue—7.5YR, 10YR
Value—6 or 7 dry, 3 or 4 moist

Chroma—2 to 4 dry or moist
Clay content—18 to 22 percent in upper part, 10 to 20 percent in lower part
Structure—subangular blocky, angular blocky, prismatic, massive
Durinode content—0 to 80 percent; weakly cemented to strongly cemented
Reaction—moderately alkaline, strongly alkaline

Larkin Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits, shoulders, and backslopes of loess hills on basalt plateaus
Parent material: Loess
Slope range: 0 to 25 percent
Elevation: 2,400 to 3,000 feet
Average annual precipitation: 19 to 28 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Ultic Argixerolls (fig. 28)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 4 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure parting to weak fine granular; very friable, soft, slightly sticky and moderately plastic; many very fine and fine roots throughout; many very fine and fine tubular pores; moderately acid; abrupt smooth boundary.

A—4 to 9 inches; dark grayish brown (10YR 4/2) silt loam, very dark gray (10YR 3/1) moist; moderate medium subangular blocky structure; very friable, soft, slightly sticky and moderately plastic; common very fine and fine roots throughout; common very fine and fine tubular pores; moderately acid; clear wavy boundary.

AB—9 to 14 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; friable, slightly hard, slightly sticky and moderately plastic; few very fine and fine roots throughout; few very fine and fine tubular pores; moderately acid; clear wavy boundary.

Bt1—14 to 19 inches; brown (10YR 5/3) silty loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, firm, slightly sticky and moderately plastic; few very fine and fine roots throughout; few very fine and fine tubular pores; 5 percent continuous prominent clay films that are dark brown (10YR 3/3) moist and on faces of peds and 5 percent continuous prominent light gray (10YR 7/2) silt coatings on faces of peds; few fine distinct spherical black (10YR 2/1) iron-manganese nodules with clear boundaries throughout; moderately acid; clear wavy boundary

Bt2—19 to 34 inches; yellowish brown (10YR 5/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium angular blocky structure; hard, firm, moderately sticky and moderately plastic; few very fine and fine roots throughout; few very fine and fine tubular pores; 5 percent continuous prominent clay films that are dark brown (10YR 3/3) moist and on faces of peds and 35 percent continuous prominent light gray (10YR 7/2) silt coatings on faces of peds; few fine

Figure 28.—Typical profile of a Larkin soil.

faint spherical black (10YR 2/1) iron-manganese nodules with clear boundaries throughout; slightly acid; clear wavy boundary.

Bt3—34 to 64 inches; yellowish brown (10YR 5/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium angular blocky structure; extremely hard, firm, moderately sticky and moderately plastic; few very fine and fine roots throughout; few very fine and fine tubular pores; 10 percent continuous prominent light gray (10YR 7/2) silt coatings on faces of peds; few fine faint spherical very dark brown (10YR 2/2) iron-manganese nodules with clear boundaries throughout; neutral.

Typical Pedon Location

Map unit in which located: Larkin-Southwick complex, 8 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 1,410 feet east and 450 feet south of the northwest corner of section 2, T. 22 N., R. 45 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 14 inches

Depth to argillic horizon—10 to 18 inches

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—15 to 25 percent
Reaction—strongly acid to slightly acid

Bt horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—18 to 35 percent
Gravel content—0 to 3 percent
Reaction—moderately acid to neutral

Some pedons do not have an AB horizon.

Latah Series

Depth class: Very deep
Drainage class: Somewhat poorly drained
Position on landscape: Drainageways, low stream terraces
Parent material: Alluvium derived from loess
Slope range: 0 to 3 percent
Elevation: 2,320 to 2,700 feet
Average annual precipitation: 18 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Fine, mixed, superactive, mesic Xeric Argialbolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 10 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; few fine tubular pores; neutral; abrupt wavy boundary

A—10 to 14 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; few fine tubular pores; few pockets of white (10YR 8/1) volcanic ash; neutral; abrupt wavy boundary

BA—14 to 19 inches; dark grayish brown (10YR 4/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many fine tubular pores; neutral; clear wavy boundary

E—19 to 22 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine and fine roots; common fine tubular pores, neutral; clear wavy boundary

Btgb1—22 to 31 inches; grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (2.5Y 3/2) moist; weak medium prismatic structure parting to moderate medium subangular blocky; moderately hard, firm, moderately sticky and moderately plastic; few very fine and fine roots; few very fine tubular pores; few fine iron-manganese concretions that are black (10YR 2/1) moist; many distinct

continuous clay films on faces of peds; moderately alkaline; clear wavy boundary.

Btgb2—31 to 38 inches; grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (2.5Y 3/2) moist; moderate medium prismatic structure; hard, very firm, very sticky and very plastic; few very fine roots; common fine prominent masses of oxidized iron that are dark yellowish brown (10YR 4/6) moist and few fine iron-manganese concretions that are black (10YR 2/1) moist; many continuous clay films on faces of peds; moderately alkaline; clear wavy boundary.

Btb—38 to 60 inches; light yellowish brown (2.5Y 6/3) silty clay loam, olive (5Y 5/3) moist; moderate medium prismatic structure; hard, very firm, moderately sticky and very plastic; many fine and medium distinct masses of oxidized iron that are dark yellowish brown (10YR 4/6) moist and few fine iron-manganese concretions that are black (10YR 2/1) moist; many continuous clay films on faces of peds; slightly alkaline.

Typical Pedon Location

Map unit in which located: Tilma-Latah complex, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 4 miles south of Spangle, Washington; about 2,920 feet north and 2,370 feet west of the southeast corner of section 28, T. 22 N., R. 43 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—17 to 30 inches
Depth to perched water table—18 to 22 inches in December and January
Depth to apparent water table—18 to 22 inches in February through April, more than 22 inches in May through November
Depth to redoximorphic features—18 to 24 inches

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—1 or 2 moist or dry
Clay content—14 to 22 inches
Reaction—slightly acid to slightly alkaline

E horizon

Value—5 to 7 dry, 4 or 5 moist
Chroma—1 or 2 moist or dry
Texture—silt loam, silt
Clay content—8 to 12 inches
Reaction—neutral, slightly alkaline

Btgb horizon

Hue—10YR, 2.5Y, 5Y
Value—5 or 6 dry, 3 or 4 dry
Chroma—1 or 2 dry or moist
Texture—silty clay loam, silty clay
Clay content—35 to 45 percent
Reaction—neutral to moderately alkaline

Btb horizon

Hue—2.5Y, 5Y, 10YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, silty clay

Clay content—30 to 45 percent
Reaction—neutral, slightly alkaline

Lenz Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes and shoulders of mountains and hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from gneiss, schist, and granite
Slope range: 3 to 60 percent
Elevation: 1,700 to 3,600 feet
Average annual precipitation: 18 to 28 inches
Average annual air temperature: 46 to 49 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, isotic, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 0.5 inch; slightly decomposed needles, leaves, twigs, and cones.
Oe—0.5 to 1 inch; moderately decomposed organic matter.
A1—1 to 4 inches; dark grayish brown (10YR 4/2) very gravelly ashy sandy loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, friable, nonsticky and slightly plastic; many very fine and fine and common medium and coarse roots; many very fine and fine tubular and irregular pores; 40 percent gravel; slightly acid; clear wavy boundary.
A2—4 to 9 inches; grayish brown (10YR 5/2) very gravelly ashy sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; many very fine and fine tubular and irregular pores; 40 percent gravel and 10 percent cobbles; slightly acid; clear wavy boundary.
Bw1—9 to 14 inches; pale brown (10YR 6/3) very gravelly ashy sandy loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and few fine and medium roots; common very fine and fine tubular and irregular pores; 30 percent gravel and 10 percent cobbles; neutral; clear wavy boundary.
Bw2—14 to 26 inches; very pale brown (10YR 7/3) very cobbly sandy loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine and fine roots; common very fine tubular and irregular pores; 25 percent gravel and 25 percent cobbles; slightly acid; clear irregular boundary.
C—26 to 38 inches; very pale brown (10YR 7/3) extremely stony sandy loam, brown (10YR 5/3) moist; massive; slightly hard, friable, nonsticky and slightly plastic; few very fine, fine, and medium roots; many very fine tubular and irregular pores; 15 percent gravel, 20 percent cobbles, and 40 percent stones; moderately acid; abrupt wavy boundary.
2R—38 inches; hard, unweathered granitic gneiss.

Typical Pedon Location

Map unit in which located: Lenz-Rock outcrop complex, 30 to 60 percent slopes

Location in survey area: Spokane County, Washington, about 5 miles southwest of Mount Spokane, Washington; about 1,470 feet west and 1,480 feet north of the southeast corner of section 3, T. 27 N., R. 44 E.

Range in Characteristics

Profile
Depth to bedrock—20 to 40 inches (lithic)
Thickness of volcanic ash influence—10 to 18 inches
Clay content—8 to 12 percent in particle-size control section

A horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—8 to 12 percent
Gravel content—35 to 50 percent
Cobble content—0 to 10 percent
Total rock fragment content—35 to 50 percent
Reaction—slightly acid, neutral

Bw1 horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy loam
Clay content—6 to 12 percent
Gravel content—20 to 50 percent
Cobble content—0 to 15 percent
Total rock fragment content—35 to 60 percent
Reaction—slightly acid, neutral

Bw2 horizon
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Clay content—6 to 12 percent
Gravel content—15 to 50 percent
Cobble content—10 to 25 percent
Stone content—0 to 5 percent
Total rock fragment content—40 to 75 percent
Reaction—slightly acid, neutral

A Bt horizon is in some pedons.

C horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Clay content—4 to 8 percent
Gravel content—15 to 45 percent
Cobble content—20 to 25 percent
Stone content—5 to 40 percent
Total rock fragment content—50 to 80 percent
Reaction—moderately acid to neutral

A BC horizon is in some pedons.

Libertybutte Series

Depth class: Shallow
Drainage class: Well drained

Position on landscape: Backslopes, shoulders, and summits of mountains and hills
Parent material: Loess over colluvium derived from argillite, siltite, and fine-grained quartzite
Slope range: 5 to 30 percent
Elevation: 2,850 to 3,700 feet
Average annual precipitation: 20 to 25 inches
Average annual air temperature: 47 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Loamy, mixed, superactive, mesic Lithic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 4 inches; dark grayish brown (10YR 4/2) gravelly silt loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure parting to weak fine granular; soft, friable, nonsticky and nonplastic; many very fine and fine roots; common very fine and fine interstitial pores; 25 percent gravel; slightly acid (pH 6.4); clear smooth boundary.

Bt1—4 to 11 inches; brown (10YR 4/3) gravelly silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; common discontinuous faint clay films on faces of peds; 25 percent gravel; neutral (pH 6.6); clear smooth boundary.

Bt2—11 to 16 inches; brown (10YR 4/3) very gravelly silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; common continuous distinct clay films on faces of peds and lining pores; 25 percent gravel and 10 percent channers; neutral (pH 6.8); abrupt smooth boundary.

Crt—16 to 19 inches; fractured, weathered metasedimentary rock with less than 5 percent soil material between fractures that are more than 4 inches apart; some clay films on weathered rock fragments; gradual wavy boundary.

R—19 inches; hard, fractured metasedimentary rock.

Typical Pedon Location

Map unit in which located: Libertybutte-Tekoa complex, 5 to 30 percent slopes
Location in survey area: Benewah County, Idaho, about 5 miles west of DeSmet, on the south flank of Liberty Butte; about 600 feet north and 1,200 feet west of the southeast corner of section 7, T. 44 N., R. 5 W.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 15 inches
Depth to bedrock (lithic)—12 to 20 inches
Depth to bedrock (paralithic)—12 to 19 inches

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—10 to 20 percent
Gravel content—15 to 30 percent
Reaction—slightly acid, neutral

Bt1 horizon
Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—silt loam, loam
Clay content—15 to 25 percent
Gravel content—15 to 30 percent
Reaction—slightly acid, neutral

Bt2 horizon
Hue—10YR, 7.5YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—silt loam, loam
Clay content—15 to 25 percent
Gravel content—15 to 30 percent
Channer content—0 to 10 percent
Cobble content—0 to 10 percent
Total rock fragment content—15 to 45 percent
Reaction—slightly acid, neutral

Lotuspoint Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes and shoulders of mountains, ridges, and hills
Parent material: Thin mantle of volcanic ash and loess over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 5 to 65 percent
Elevation: 2,030 to 4,840 feet
Average annual precipitation: 28 to 40 inches
Average annual air temperature: 42 to 50 degrees F
Frost-free period: 90 to 140 days

Taxonomic class: Loamy-skeletal, isotic, mesic Andic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material consisting of needles, bark, leaves, twigs, and cones.
Oe—1 to 2 inches; moderately decomposed plant material mixed with 1980's Mount St. Helens volcanic ash.
A—2 to 4 inches; dark grayish brown (10YR 4/2) stony ashy silt loam, very dark brown (10YR 2/2) moist; weak very fine and fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and few medium and coarse roots; many very fine and fine and few medium tubular pores; 15 percent gravel, 5 percent cobbles, and 5 percent stones; slightly acid (pH 6.5); abrupt wavy boundary.
AB—4 to 10 inches; brown (10YR 4/3) stony ashy silt loam, dark brown (7.5YR 3/2) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and few medium and coarse roots; many very fine and fine and few medium tubular pores; 5 percent gravel, 5 percent cobbles, and 15 percent stones; moderately acid (pH 6.0); clear wavy boundary.

2Bw1—10 to 16 inches; light yellowish brown (10YR 6/4) extremely stony silt loam, brown (7.5YR 4/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and few medium and coarse roots; many very fine and fine and few medium and coarse tubular pores; 5 percent gravel, 25 percent cobbles, and 50 percent stones; moderately acid (pH 6.0); clear wavy boundary.
2Bw2—16 to 26 inches; light yellowish brown (10YR 6/4) extremely stony loam, brown (7.5YR 4/4) moist; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and few medium and coarse roots; many very fine and fine, common medium, and few coarse tubular pores; few faint clay films lining pores; 5 percent gravel, 30 percent cobbles, and 50 percent stones; moderately acid (pH 6.0); abrupt irregular boundary.
2R—26 inches; fractured, fine-grained quartzite.

Typical Pedon Location

Map unit in which located: Lotuspoint stony ashy silt loam, 35 to 65 percent slopes, stony
Location in survey area: Benewah County, Idaho, about 7 miles southeast of Plummer; about 1,450 feet south and 1,450 feet east of the northwest corner of section 21, T. 46 N., R. 3 W.

Range in Characteristics

Profile
Depth to bedrock—20 to 40 inches (lithic)
Thickness of volcanic ash mantle—7 to 12 inches

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam
Clay content—3 to 8 percent
Gravel content—15 to 25 percent
Channer content—0 to 10 percent
Cobble content—0 to 10 percent
Stone content—0 to 10 percent
Total rock fragment content—15 to 30 percent
Reaction—slightly acid, neutral

AB horizon (where present)
Hue—10YR, 7.5YR
Value—4 or 5 dry, 3 moist
Chroma—3 or 4 dry, 2 or 3 moist
Texture—ashy silt loam
Clay content—3 to 8 percent
Gravel content—5 to 30 percent
Channer content—0 to 10 percent
Cobble content—0 to 15 percent
Stone content—0 to 20 percent
Total rock fragment content—25 to 55 percent
Reaction—moderately acid to neutral

2Bw horizon
Hue—10YR, 7.5YR
Value—6 or 7 dry, 4 or 5 moist

Chroma—3 or 4 moist
Texture—silt loam, loam
Clay content—3 to 10 percent
Gravel content—5 to 30 percent
Channer content—0 to 10 percent
Cobble content—25 to 50 percent
Stone content—0 to 50 percent
Total rock fragments content—50 to 85 percent
Reaction—moderately acid, slightly acid

2C horizon (where present)
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 moist
Texture—silt loam, loam
Clay content—3 to 10 percent
Gravel content—15 to 60 percent
Channer content—0 to 5 percent
Cobble content—20 to 70 percent
Stone content—0 to 30 percent
Flagstone content—0 to 15 percent
Total rock fragment content—60 to 90 percent
Reaction—moderately acid, slightly acid

Lovell Series

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Drainageways
Parent material: Mixed alluvium with an influence of loess and volcanic ash in the upper part
Slope range: 0 to 3 percent
Elevation: 2,580 to 3,230 feet
Average annual precipitation: 25 to 28 inches
Average annual air temperature: 43 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Fine-silty, isotic, frigid Aquandic Epiaqualfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 8 inches; light brownish gray (10YR 6/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; many fine interstitial pores; moderately acid (pH 6.0); abrupt smooth boundary.
Eg1—8 to 14 inches; gray (10YR 6/1) ashy silt loam, very dark brown (10YR 2/2) moist; weak medium platy structure parting to weak fine subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; many fine tubular pores; common fine weakly cemented black (10YR 2/1) iron-manganese concretions; slightly acid (pH 6.4); clear smooth boundary.
Eg2—14 to 18 inches; gray (10YR 6/1) ashy silt loam, very dark gray (10YR 3/1) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few very fine roots; many fine tubular pores; common fine weakly cemented black (10YR 2/1) iron-manganese concretions; slightly acid (pH 6.5); abrupt smooth boundary.

EBtg—18 to 22 inches; gray (10YR 6/1) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium platy structure; hard, friable, slightly sticky and slightly plastic; few very fine roots; many fine tubular pores; few very dark brown (10YR 2/2) clay films on faces of peds; common fine weakly cemented black (10YR 2/1) iron-manganese concretions; neutral (pH 6.7); abrupt smooth boundary.

Bt1—22 to 26 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; weak fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; many fine and very fine tubular pores; few distinct clay films along pores and few distinct very dark brown (10YR 2/2) clay films on faces of peds; neutral (pH 7.0); abrupt smooth boundary.

Bt2—26 to 34 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; weak thin and medium platy structure; hard, firm, slightly sticky and slightly plastic; many fine tubular pores; few distinct clay films along pores and common continuous prominent very dark brown (10YR 2/2) clay films on faces of peds; neutral (pH 7.0); clear smooth boundary.

2Bt3—34 to 37 inches; light gray (10YR 7/2) loam, dark grayish brown (10YR 4/2) moist; weak thin platy structure; hard, firm, slightly sticky and slightly plastic; common very fine tubular pores; few distinct clay films along pores and common continuous prominent very dark grayish brown (10YR 3/2) clay films on faces of peds; neutral (pH 7.0); clear smooth boundary.

2Bt4—37 to 44 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; weak thin platy structure; slightly hard, firm, slightly sticky and slightly plastic; common very fine tubular pores; few distinct clay films along pores and few continuous prominent very dark gray (10YR 3/1) clay films on faces of peds; neutral (pH 6.7); clear smooth boundary.

2Bt5—44 to 51 inches; very pale brown (10YR 7/3) loam, brown (10YR 4/3) moist; weak thin platy structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine tubular pores; few distinct clay films along pores; common medium and coarse reddish brown (5YR 5/4) masses of oxidized iron; neutral (pH 6.8); abrupt smooth boundary.

2BC—51 to 60 inches; light gray (10YR 7/2) loam, pale brown (10YR 6/3) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine tubular pores; common fine weakly cemented black (10YR 2/1) iron-manganese concretions; many coarse reddish brown (5YR 5/4) and yellowish red (5YR 5/6) masses of oxidized iron; neutral (pH 6.9).

Typical Pedon Location

Map unit in which located: Latahco-Lovell complex, 0 to 3 percent slopes

Location in survey area: Benewah County, Idaho, about 1.5 miles northwest of Tensed and 300 feet west of U.S. Route 95, at Benewah Creek Road intersection; about 600 feet north and 45 feet east of the center of section 10, T. 44 N., R. 5 W.

Range in Characteristics

Profile

Depth to argillic horizon that perches water—15 to 25 inches

Depth to perched water table (episaturation)—12 to 20 inches in January through June

Depth to aquic conditions with chroma of 2 or less and redoximorphic concentrations—6 to 10 inches

Thickness of volcanic ash influence—12 to 20 inches

Ap horizon

Value—5 or 6 dry, 2 to 4 moist

Chroma—2 to 4 dry, 2 or 3 moist

Texture—ashy silt loam

Clay content—15 to 25 percent
Reaction—moderately acid to neutral

Eg horizon
Hue—10YR, 2.5Y
Value—6 dry, 2 to 4 moist
Chroma—1 dry, 1 or 2 moist
Texture—ashy silt loam
Clay content—15 to 24 percent
Reaction—moderately acid to neutral

EBtg horizon
Hue—10YR, 2.5Y
Value—6 dry, 2 to 4 moist
Chroma—1 or 2 dry or moist
Texture—silt loam
Clay content—18 to 25 percent
Reaction—moderately acid to neutral

Bt horizon
Hue—10YR
Value—6 or 7 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—20 to 30 percent
Reaction—slightly acid, neutral

2Bt2 horizon
Hue—10YR
Value—6 or 7 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—loam, silt loam, silty clay loam
Clay content—20 to 30 percent
Reaction—slightly acid, neutral

2BC horizon
Hue—10YR
Value—6 or 7 dry, 4 to 6 moist
Chroma—2 to 4 dry or moist
Texture—loam, silt loam
Clay content—16 to 25 percent
Reaction—slightly acid, neutral

Lovell Taxadjunct

Depth class: Very deep
Drainage class: Somewhat poorly drained
Position on landscape: Treads of drainageways
Parent material: Mixed alluvium with an influence of loess and volcanic ash in the upper part
Slope range: 0 to 3 percent
Elevation: 2,300 to 2,800 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 42 to 46 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Fine-silty, isotic, frigid Aquandic Haploxeralfs

Taxadjunct Features

The Lovell soils in this survey area are a taxadjunct to the series because they do not meet the criteria for the Aqualf suborder, which requires redoximorphic features in the upper 12 centimeters of the argillic horizon. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 2 inches; light brownish gray (10YR 6/2) ashy silt loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and moderately plastic; many very fine roots; many fine tubular pores; moderately acid; clear smooth boundary.

Ap2—2 to 8 inches; pale brown (10YR 6/3) ashy silt loam, dark grayish brown (10YR 4/2) moist; moderate medium platy structure; slightly hard, firm, slightly sticky and moderately plastic; common very fine and fine roots; common very fine and fine tubular pores; moderately acid; clear smooth boundary.

BE—8 to 19 inches; very pale brown (10YR 7/3) ashy silt loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; slightly hard, firm, slightly sticky and moderately plastic; few very fine and fine roots; common very fine tubular pores; few iron-manganese masses and concretions; neutral; abrupt smooth boundary.

E—19 to 24 inches; very pale brown (10YR 8/2) silt loam, grayish brown (10YR 5/2) moist; weak medium angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few fine and common very fine tubular pores and few very fine irregular pores; few iron-manganese masses and concretions; neutral; abrupt wavy boundary.

Bt/E—24 to 30 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 4/4) moist (Btb part), and very pale brown (10YR 7/3) silty clay loam, brown (10YR 4/3) moist (E part); moderate medium subangular blocky structure; very hard, very firm, moderately sticky and moderately plastic; few very fine roots; few fine and common very fine irregular and tubular pores; 20 percent distinct skeletans and 30 percent distinct clay films on faces of peds; few iron depletions and masses of oxidized iron; neutral; clear wavy boundary.

Bt1—30 to 42 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; strong medium subangular blocky structure; extremely hard, extremely firm, moderately sticky and moderately plastic; few very fine irregular and tubular pores; 30 percent distinct clay films on faces of peds; few iron depletions and masses of oxidized iron; neutral; gradual wavy boundary.

Bt2—42 to 52 inches; light yellowish brown (10YR 6/4) silty clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; very hard, extremely firm, moderately sticky and moderately plastic; few very fine tubular pores; 25 percent distinct clay films on faces of peds; common fine masses of oxidized iron and many medium iron depletions; neutral; clear wavy boundary.

Bt3—52 to 61 inches; pale brown (10YR 6/3) silty clay loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; very hard, very firm, moderately sticky and moderately plastic; few very fine irregular pores; 20 percent faint clay films on faces of peds; common fine and medium masses of oxidized iron and many coarse iron depletions; neutral.

Typical Pedon Location

Map unit in which located: Lovell ashy silt loam, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 4.75 miles southeast of Mica Peak, about 1,500 feet southeast of Mica Peak Cemetery; about 840 feet south and 1,200 feet west of the northeast corner of section 11, T. 23 N., R. 45 E.

Range in Characteristics

Profile
Thickness of ochric epipedon—5 to 10 inches
Thickness of volcanic ash influence—7 to 20 inches
Depth to redoximorphic features—19 to 40 inches
Depth to top of perched water table—19 to 24 inches in January through April
Depth to top of argillic horizon that perches water—20 to 30 inches

Ap horizon
Hue—10YR, 2.5Y
Value—5 or 6 dry, 2 or 4 moist
Chroma—1 to 4 dry, 1 to 3 moist
Clay content—20 to 27 percent
Reaction—moderately acid, slightly acid

BE and E horizon
Value—7 or 8 dry, 4 or 5 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam, silt loam
Clay content—15 to 25 percent
Reaction—slightly acid, neutral

Bt/E horizon
Value of Btb part—5 or 6 dry, 3 or 4 moist
Value of E part—7 or 8 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, silt loam
Clay content—18 to 30 percent
Reaction—slightly acid, neutral

Bt horizon
Hue—10YR, 2.5Y
Value—6 or 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—loam, silty clay loam, silt loam
Clay content—18 to 35 percent
Reaction—neutral, slightly alkaline

Marble Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers on outwash plains, earthflows, and terraces
Parent material: Sandy glaciofluvial deposits
Slope range: 0 to 55 percent
Elevation: 1,540 to 2,500 feet
Average annual precipitation: 15 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Mixed, mesic Lamellic Xerospamments

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; litter of partially decomposed needles, leaves, and twigs.
A—1 to 4 inches; grayish brown (10YR 5/2) loamy sand, very dark grayish brown (10YR 3/2) moist; weak coarse granular structure; soft, very friable, nonsticky and nonplastic; many very fine, common fine, and few medium roots; common fine interstitial pores; slightly acid; clear wavy boundary.
E—4 to 8 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few medium and coarse roots; common fine interstitial pores; slightly acid; clear wavy boundary.
E and Bt1—8 to 27 inches; pale brown (10YR 6/3) sand, brown (10YR 4/3) moist (E part); single grain; loose, nonsticky and nonplastic; few faint irregular wavy continuous 1/8- to 1/4-inch-thick yellowish brown (10YR 5/6) bands of loamy coarse sand, dark yellowish brown (10YR 4/6) moist (Bt part); massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine, medium, and coarse roots; common fine interstitial pores; neutral; gradual wavy boundary.
E and Bt2—27 to 53 inches; pale brown (10YR 6/3) sand, brown (10YR 4/3) moist (E part); single grain; loose, nonsticky and nonplastic; common prominent irregular wavy continuous 1/8- to 1/2-inch-thick yellowish brown (10YR 5/6) bands of loamy coarse sand, dark yellowish brown (10YR 4/6) moist (Bt part); massive; slightly hard, friable, nonsticky and nonplastic; few very fine and coarse roots; common fine interstitial pores; slightly acid; gradual wavy boundary.
C—53 to 60 inches; variegated sand; single grain; loose, nonsticky and nonplastic; few very fine roots; many fine interstitial pores; neutral.

Typical Pedon Location

Map unit in which located: Marble loamy sand, 8 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 1 mile east of the intersection of U.S. Route 2 and Day Mount Spokane Road; about 420 feet south and 400 feet west of the northeast corner of section 35, T. 27 N., R. 43 E.

Range in Characteristics

Profile
Thickness of ochric epipedon—5 to 15 inches
Reaction—slightly acid, neutral

A horizon
Value—4 or 5 dry, 2 to 4 moist
Chroma—2 or 3 dry or moist
Clay content—2 to 5 percent

E horizon
Value—6 or 7 dry
Chroma—3 or 4 dry or moist
Texture—loamy sand, sand, loamy coarse sand
Clay content—2 to 5 percent

E and Bt horizon
E part (90 to 95 percent of horizon):
Value—6 or 7 dry
Chroma—2 to 4 dry or moist

Texture—loamy sand, sand, loamy coarse sand, coarse sand
Clay content—0 to 2 percent
Fine gravel content—0 to 5 percent

Bt part (5 to 10 percent of horizon):
Value—4 or 5 dry or moist
Chroma—4 or 6 dry or moist
Texture—loamy sand, sand, loamy coarse sand, coarse sand
Combined thickness of lamellae—less than 6 inches

C horizon
Hue—10YR, 2.5Y, variegated
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—coarse sand, sand
Clay content—0 to 2 percent
Fine gravel content—0 to 5 percent
Lamellae—present in some pedons

Marblespring Series

Depth class: Very deep
Drainage class: Somewhat excessively drained
Position on landscape: Treads on outwash terraces
Parent material: Sandy and gravelly glaciofluvial deposits
Slope range: 0 to 15 percent
Elevation: 1,540 to 2,100 feet
Average annual precipitation: 16 to 20 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Sandy-skeletal, mixed, mesic Typic Xerorthents

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 0.5 inch; slightly decomposed needles, leaves, and twigs.
A1—0.5 to 2 inches; brown (10YR 5/3) fine gravelly loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; common very fine roots; many fine and very fine interstitial pores; 5 percent medium and 25 percent fine subrounded gravel; moderately acid; gradual wavy boundary.
A2—2 to 7 inches; pale brown (10YR 6/3) fine gravelly loamy coarse sand, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and few medium roots; many fine interstitial pores; 5 percent medium and 25 percent fine subrounded gravel; moderately acid; clear wavy boundary.
E and Bt1—7 to 27 inches; very pale brown (10YR 7/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist (E part); single grain; loose, nonsticky and nonplastic; five faint irregular wavy 1/8- to 1/4-inch-thick yellowish brown (10YR 5/4) loamy coarse sand lamellae, dark yellowish brown (10YR 4/4) moist (Bt part); massive; soft, very friable, nonsticky and nonplastic; common fine and medium roots; many fine interstitial pores; 5 percent medium and 35 percent fine subrounded gravel; 15 percent clay bridging sand grains in Bt part; slightly acid; gradual wavy boundary.

E and Bt2—27 to 51 inches; very pale brown (10YR 7/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist (E part); single grain, loose, nonsticky and nonplastic; eight faint irregular wavy 1/8- to 1/4-inch-thick loamy coarse sand lamellae (Bt part); single grain; loose, nonsticky and nonplastic; common medium and coarse roots; many fine interstitial pores; 10 percent medium and 35 percent fine subrounded gravel; neutral; gradual wavy boundary.

C—51 to 60 inches; multicolored very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; many medium interstitial pores; 5 percent medium and 30 percent fine subrounded gravel; neutral.

Typical Pedon Location

Map unit in which located: Marblespring fine gravelly loamy coarse sand, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 1 mile northeast of Mead, Washington; about 2,500 feet east and 1,700 feet south of the northwest corner of section 26, T. 27 N., R. 43 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—3 to 7 inches

Rock fragment content—averages 35 to 55 percent in particle-size control section, dominantly fine gravel

Calcium carbonate and silica accumulations—on underside of some gravel

A horizon

Value—5 or 6 dry, 3 or 4 moist

Chroma—2 to 4 dry or moist

Clay content—5 to 10 percent

Fine gravel content—15 to 30 percent

Medium gravel content—0 to 5 percent

Total rock fragment content—15 to 35 percent

Reaction—moderately acid, slightly acid

E and Bt1 horizon

E part (90 to 98 percent of horizon):

Value—5 to 7 dry, 4 or 5 moist

Chroma—3 or 4 dry or moist

Texture—loamy coarse sand

Clay content—5 to 10 percent

Fine gravel content—30 to 45 percent

Medium gravel content—0 to 10 percent

Cobble content—0 to 2 percent

Total rock fragment content—35 to 55 percent

Bt part (2 to 10 percent of horizon):

Total thickness of lamellae—less than 6 inches

Reaction—slightly acid, neutral

E and Bt2 horizon

E part (90 to 98 percent of horizon):

Value—5 to 7 dry, 4 or 5 moist

Chroma—3 or 4 dry or moist

Texture—loamy coarse sand, coarse sand

Clay content—5 to 10 percent

Fine gravel content—30 to 45 percent

Medium gravel content—0 to 10 percent

Cobble content—0 to 2 percent
Total rock fragment content—35 to 55 percent

Bt part (2 to 10 percent of horizon):
Total thickness of lamellae—less than 6 inches
Reaction—slightly acid, neutral

C horizon
Texture—coarse sand
Clay content—0 to 3 percent
Fine gravel content—30 to 45 percent
Medium gravel content—0 to 5 percent
Cobble content—0 to 2 percent
Total rock fragment content—35 to 50 percent
Reaction—slightly acid, neutral
Few faint lamellae—may be present in some pedons

McCrosket Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes of mountains and hills
Parent material: Volcanic ash and loess over colluvium and residuum derived from fine-grained quartzite and siltite
Slope range: 15 to 65 percent
Elevation: 2,600 to 4,000 feet
Average annual precipitation: 20 to 35 inches
Average annual air temperature: 42 to 49 degrees F
Frost-free period: 90 to 140 days

Taxonomic class: Loamy-skeletal, isotic, frigid Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material.
Oe—1 to 2 inches; moderately decomposed plant material mixed with 1980's Mount St. Helens volcanic ash.
A1—2 to 5 inches; dark grayish brown (10YR 4/2) gravelly ashy silt loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine and common medium tubular pores; 25 percent gravel; slightly acid; gradual wavy boundary.
A2—5 to 12 inches; brown (10YR 5/3) gravelly ashy silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine and common medium tubular pores; 30 percent gravel; neutral; clear wavy boundary.
Bw1—12 to 20 inches; light brown (7.5YR 6/3) very cobbly silt loam, brown (7.5YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and few fine and medium tubular pores; 25 percent gravel and 30 percent cobbles; moderately acid; gradual wavy boundary.
Bw2—20 to 32 inches; light brown (7.5YR 6/3) very cobbly silt loam, brown (7.5YR 4/3) moist; weak coarse subangular blocky structure; slightly hard, friable, slightly

sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine and few fine and medium tubular pores; 20 percent gravel and 35 percent cobbles; moderately acid; gradual wavy boundary.

BC—32 to 42 inches; pink (7.5YR 7/3) extremely cobbly loam, brown (7.5YR 5/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common very fine and few fine tubular pores; 15 percent gravel and 45 percent cobbles; moderately acid; abrupt wavy boundary.

Cr—42 inches; fractured, weathered siltite.

Typical Pedon Location

Map unit in which located: Ardenvoir-McCrosket association, 35 to 65 percent slopes

Location in survey area: Benewah County, Idaho, about 0.5 mile northwest of Windfall Pass summit; about 1,900 feet south and 2,000 feet west of the northeast corner of section 16, T. 45 N., R. 4 W.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 17 inches
Depth to bedrock—40 to 60 inches (paralithic)

A horizon

Hue—10YR, 7.5YR
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—5 to 15 percent
Gravel content—15 to 30 percent
Cobble content—0 to 15 percent
Total rock fragment content—15 to 30 percent
Reaction—slightly acid, neutral

Bw horizon

Hue—7.5YR, 10YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, loam
Clay content—10 to 25 percent
Gravel content—20 to 35 percent
Cobble content—15 to 40 percent
Total rock fragment content—35 to 55 percent
Reaction—slightly acid, neutral

BC horizon

Hue—10YR, 7.5YR
Value—6 or 7 dry, 4 to 6 moist
Chroma—3 to 6 dry or moist
Texture—loam, silt loam
Clay content—5 to 20 percent
Gravel content—10 to 50 percent
Cobble content—20 to 50 percent
Stone—0 to 15 percent
Total rock fragment content—35 to 70 percent
Reaction—moderately acid, slightly acid

Micapeak Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Summits, shoulders, and backslopes of mountains, hills, and ridges
Parent material: Colluvium and residuum derived from granite, gneiss, and schist with an influence of loess and volcanic ash in the upper part
Slope range: 8 to 55 percent
Elevation: 1,700 to 4,200 feet
Average annual precipitation: 20 to 40 inches
Average annual air temperature: 41 to 50 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Coarse-loamy, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 0.75 inch; slightly decomposed needles, twigs, leaves, and cones.
Oe—0.75 to 1 inch; moderately decomposed organic matter mixed with a discontinuous minor amount of 1980's Mount St. Helens volcanic ash.
A—1 to 7 inches; grayish brown (10YR 5/2) gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine irregular and tubular pores; 5 percent fine mica flakes; 15 percent gravel; slightly acid; clear irregular boundary.
Bw1—7 to 13 inches; light yellowish brown (10YR 6/4) gravelly ashy loam, dark yellowish brown (10YR 3/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine irregular pores and few medium tubular pores; 10 percent fine mica flakes; 25 percent gravel; slightly acid; gradual wavy boundary.
Bw2—13 to 22 inches; light yellowish brown (10YR 6/4) gravelly loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine irregular pores and common very fine and fine tubular pores; 15 percent fine mica flakes; 20 percent gravel; moderately acid; clear wavy boundary.
BCt—22 to 33 inches; light yellowish brown (10YR 6/4) gravelly loam, dark yellowish brown (10YR 4/4) moist; weak medium and coarse angular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine irregular pores and few fine tubular pores; 15 percent fine mica flakes; one discontinuous wavy 0.1- to 0.25-inch-thick band of loam that is dark yellowish brown (10YR 4/6) moist; 10 percent paragravel and 20 percent gravel; moderately acid; clear wavy boundary.
C—33 to 39 inches; very pale brown (10YR 7/4) gravelly sandy loam, yellowish brown (10YR 5/4) moist; massive; hard, friable, nonsticky and slightly plastic; few very fine, fine, and medium roots; many very fine irregular pores and few fine tubular pores; 15 percent fine mica flakes; pockets of material that is 50 percent fine mica flakes comprise about 5 percent of horizon; 15 percent paragravel and 15 percent gravel; moderately acid; abrupt wavy boundary.

Cr—39 inches; weathered micaceous gneiss and schist; no roots; can be dug with spade with moderate difficulty; rock structure clearly visible.

Typical Pedon Location

Map unit in which located: Quinnamose-Micapeak complex, 30 to 55 percent slopes
Location in survey area: Spokane County, Washington, about 1.5 miles west of Mica Peak and 0.75 mile south of Belmont Road; about 1,835 feet east and 1,480 feet north of the southwest corner of section 16, T. 24 N., R. 45 E.

Range in Characteristics

Profile
Thickness of volcanic ash influence—8 to 14 inches
Depth to bedrock (paralithic)—20 to 40 inches
Depth to bedrock (lithic)—40 to 60 inches or more
Clay content in particle-size control section—5 to 12 percent
Mica content—2 to 15 percent

A horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 or 3 dry or moist
Clay content—8 to 12 percent
Gravel content—15 to 25 percent
Reaction—moderately acid, slightly acid

Bw1 horizon
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy loam, ashy silt loam
Clay content—8 to 12 percent
Gravel content—10 to 25 percent
Total rock fragment content—10 to 25 percent
Reaction—moderately acid, slightly acid

Bw2 and BCt horizons
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam, coarse sandy loam
Clay content—5 to 12 percent
Gravel content—10 to 30 percent
Paragravel content—0 to 10 percent
Total rock fragment content—10 to 30 percent
Reaction—moderately acid, slightly acid

C horizon
Hue—10YR, 2.5Y
Value—6 to 8 dry, 5 to 7 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, coarse sandy loam
Clay content—5 to 10 percent
Gravel content—10 to 30 percent
Paragravel content—10 to 20 percent
Total rock fragment content—20 to 40 percent
Reaction—moderately acid, slightly acid

Mondovi Taxadjunct

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Drainageways
Parent material: Mixed alluvium derived from loess and a minor amount of volcanic ash
Slope range: 0 to 8 percent
Elevation: 2,000 to 2,700 feet
Mean annual precipitation: 15 to 22 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Coarse-silty, mixed, superactive, mesic Vitrandic Haploxerolls

Taxadjunct Features

The Mondovi soils in this survey area are a taxadjunct to the series because the surface layer has properties that meet the criteria for the Vitrandic subgroup. These soils have an assumed irregular decrease in organic carbon content (Cumulic subgroup). This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 17 inches; dark grayish brown (10YR 4/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many fine and very fine roots; many fine and very fine irregular pores; noneffervescent; moderately acid; clear wavy boundary.
A2—17 to 26 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many fine and very fine roots; many fine and very fine irregular pores; noneffervescent; neutral; clear wavy boundary.
A3—26 to 38 inches; dark grayish brown (10YR 4/2) ashy silt loam, black (10YR 2/1) moist; massive; soft, very friable, slightly sticky and nonplastic; common fine and very fine roots; many fine and very fine irregular pores; noneffervescent; neutral; clear wavy boundary.
A4—38 to 48 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; massive; soft, very friable, slightly sticky and nonplastic; common fine and very fine roots; many fine and very fine irregular pores; noneffervescent; neutral; clear wavy boundary.
A5—48 to 60 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 3/3) moist; massive; soft, very friable, slightly sticky and nonplastic; cemented with silica; common fine and very fine roots; many fine and very fine irregular pores; noneffervescent; neutral.

Typical Pedon Location

Map unit in which located: Mondovi silt loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington; about 2 miles west of Cheney, Washington; about 1,300 feet east and 460 feet north of the southwest corner of section 3, T. 23 N, R. 41 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—40 to 60 inches or more
Depth to apparent water table—44 to 60 inches in March through April
Depth to redoximorphic features (where present)—44 to 60 inches or more

A1 horizon
Value—3 or 4 dry, 2 or 3 moist
Chroma—1 or 2 moist or dry
Clay content—12 to 20 percent
Reaction—moderately acid to neutral

A2 horizon
Value—3 or 4 dry, 2 or 3 moist
Chroma—1 or 2 moist or dry
Texture—ashy silt loam, silt loam
Clay content—12 to 20 percent
Reaction—moderately acid to neutral

A3 horizon
Value—3 or 4 dry, 2 or 3 moist
Chroma—1 to 3 moist or dry
Texture—ashy silt loam, silt loam
Clay content—8 to 18 percent
Reaction—neutral, slightly alkaline

A4 horizon
Value—3 or 4 dry, 2 or 3 moist
Chroma—1 to 3 moist or dry
Texture—ashy silt loam, silt loam
Clay content—6 to 18 percent
Reaction—neutral, slightly alkaline

A5 horizon
Value—3 to 5 dry, 2 to 4 moist
Chroma—2 to 4 dry or moist
Texture—ashy silt loam, silt loam
Clay content—5 to 18 percent
Gravel content—0 to 5 percent
Reaction—neutral, slightly alkaline

Morical Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Summits and shoulders of hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite and quartzite
Slope range: 0 to 30 percent
Elevation: 2,400 to 2,950 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine-loamy, mixed, superactive, mesic Vitrandic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 6 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; moderate thick platy structure; soft, very friable, slightly sticky and moderately plastic; common very fine roots throughout; common very fine irregular pores; moderately acid; abrupt smooth boundary.

AB—6 to 12 inches; brown (10YR 4/3) ashy silt loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and moderately plastic; common very fine roots throughout; common very fine and fine irregular pores; 1 percent subangular quartzite paragravel; moderately acid; clear wavy boundary.

2Bt1—12 to 18 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure parting to moderate medium granular; slightly hard, friable, moderately sticky and moderately plastic; common very fine roots throughout; common very fine irregular pores; 30 percent clay films on faces of peds; 1 percent subangular quartzite paragravel; slightly acid; clear wavy boundary.

2Bt2—18 to 27 inches; light yellowish brown (10YR 6/4) very paragravelly sandy clay loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; slightly hard, friable, moderately sticky and moderately plastic; common very fine roots in cracks; common very fine and fine irregular pores; 25 percent clay films on faces of peds; 35 percent subangular quartzite paragravel; slightly acid; abrupt wavy boundary.

2Cr—27 inches; decomposed quartzite.

Typical Pedon Location

Map unit in which located: Morical ashy silt loam, 0 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 2.5 miles southwest of Marshall, Washington; about 800 feet north and 500 feet east of the southwest corner of section 20, T. 24 N., R. 42 E.

Range in Characteristics

Profile

Depth to bedrock—20 to 40 inches (paralithic)
Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—10 to 20 inches
Reaction—moderately acid to neutral
Clay content in particle-size control section—18 to 35 percent
Hard rock fragment content in particle-size control section—averages less than 15 percent

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—15 to 25 percent
Paragravel content—0 to 5 percent

AB horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy loam, ashy silt loam, loam, silt loam
Clay content—15 to 25 percent

Paragravel content—0 to 5 percent
Gravel content—0 to 5 percent

2Bt horizon
Hue—7.5YR, 10YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—clay loam, loam, sandy loam, sandy clay loam, silt loam
Clay content—18 to 35 percent
Paragravel content—0 to 35 percent
Gravel content—0 to 15 percent

Naff Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits, backslopes, and footslopes of loess hills on basalt plateaus
Parent material: Holocene and late Pleistocene loess deposits
Slope range: 0 to 35 percent
Elevation: 2,200 to 2,880 feet
Average annual precipitation: 18 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 150 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Typic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 8 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak thick platy structure and moderate fine granular; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine pores; neutral; abrupt smooth boundary.

A—8 to 17 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak coarse prismatic structure and moderate fine granular; hard, friable, slightly sticky and moderately plastic; many very fine and fine roots; many very fine pores; slightly acid; clear wavy boundary.

BA—17 to 26 inches; brown (10YR 5/3) silt loam, dark brown (10YR 4/3) moist; moderate fine prismatic structure; hard, firm, moderately sticky and moderately plastic; many very fine and fine roots; many very fine pores; peds and pores coated with clean very fine sand and silt grains; few thin clay films visible below coatings on peds; neutral; gradual wavy boundary.

Bt1—26 to 61 inches; pale brown (10YR 6/3) silty clay loam, dark brown (10YR 4/3) moist; moderate medium prismatic structure parting to moderate fine angular blocky; very hard, firm, very sticky and very plastic; common fine roots; many very fine pores; prism faces coated with silt or very fine sand; thin clay films on blocks and in some pores; few black manganese stains and very fine manganese concretions; neutral; gradual wavy boundary.

Bt2—61 to 80 inches; pale brown (10YR 6/3) silty clay loam, brown (10YR 5/3) moist; moderate medium prismatic structure parting to moderate fine angular blocky; hard, firm, moderately sticky and moderately plastic; few fine roots; many very fine pores; thin continuous clay films on peds and in pores; common black manganese stains and very fine manganese concretions; neutral.

Typical Pedon Location

Map unit in which located: Naff-Thatuna complex, 8 to 25 percent slopes
Location in survey area: Spokane County, Washington, about 5.7 miles southeast of Fairfield, Washington; about 800 feet south and 85 feet west of the northeast corner of section 2, T. 21 N., R. 45 E.

Range in Characteristics

Profile
Depth of mollic epipedon—10 to 20 inches
Clay content in particle-size control section—25 to 35 percent

A horizon
Hue—10YR
Value—4 or 5 dry, 1 to 3 moist
Chroma—1 or 2 dry or moist
Clay content—15 to 25 percent
Reaction—moderately acid to neutral

BA horizon
Hue—10YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—20 to 30 percent
Reaction—slightly acid, neutral

Bt horizon
Hue—7.5YR, 10YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 to 6 dry or moist
Texture—silt loam, silty clay loam
Clay content—25 to 35 percent
Reaction—slightly acid to slightly alkaline
Sand and silt coatings—light gray very fine sand and silt; range from a few grains to 1 millimeter thick

Nakarna Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes and footslopes of mountains and hills
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from micaceous schist
Slope range: 15 to 60 percent
Elevation: 2,800 to 4,300 feet
Average annual precipitation: 25 to 32 inches
Average annual air temperature: 41 to 45 degrees F
Frost-free period: 60 to 110 days

Taxonomic class: Ashy over loamy, amorphic over micaceous, frigid Typic Udivitrands

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, leaves, and twigs.
Oe—1 to 3 inches; moderately decomposed organic material.

A—3 to 4 inches; yellowish brown (10YR 5/4) ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine tubular and irregular pores; neutral; clear wavy boundary.

Bw1—4 to 15 inches; light yellowish brown (10YR 6/4) ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine, fine, and medium and few coarse roots; many very fine and fine irregular and tubular pores; 1 percent very fine mica flakes; slightly acid; gradual wavy boundary.

Bw2—15 to 19 inches; brownish yellow (10YR 6/6) ashy silt loam, dark yellowish brown (10YR 4/6) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine roots; many very fine and fine irregular and tubular pores; 1 percent very fine mica flakes; neutral; abrupt wavy boundary.

2Bw3—19 to 33 inches; pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; weak coarse subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine and fine roots; many very fine irregular pores and common fine tubular pores; 20 percent fine mica flakes; 10 percent paragravel; neutral; clear wavy boundary.

2E and Bt—33 to 44 inches; very pale brown (10YR 6/3) paragravelly sandy loam, brown (10YR 4/3) moist (E part); weak medium and coarse subangular blocky structure; soft, friable, nonsticky and slightly plastic; few very fine and fine roots; many very fine tubular pores and common fine irregular pores; one discontinuous 2-millimeter-thick clay band that is light yellowish brown (10YR 6/4), dark yellowish brown (10YR 4/4) moist and in lower part of horizon (Bt part); 40 percent fine and medium mica flakes; 15 percent paragravel; slightly acid; gradual wavy boundary.

2BC—44 to 54 inches; light yellowish brown (10YR 6/4) paragravelly loamy coarse sand, dark yellowish brown (10YR 4/4) moist; weak coarse subangular blocky structure; soft, friable, nonsticky and nonplastic; few very fine and fine roots; many very fine and fine irregular pores; 60 percent fine and medium mica flakes; 25 percent paragravel; slightly acid; clear wavy boundary.

2Cr—54 inches; highly weathered, micaceous schist.

Typical Pedon Location

Map unit in which located: Nakarna ashy silt loam, 30 to 60 percent slopes

Location in survey area: Spokane County, Washington, about 3 miles east of Mica, Washington; about 615 feet west and 1,885 feet north of the southeast corner of section 20, T. 24 N., R. 45 E.

Range in Characteristics

Profile

Depth to bedrock—40 to 60 inches (paralithic)
Thickness of volcanic ash mantle—14 to 27 inches thick

A horizon

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Clay content—5 to 8 percent
Gravel content—0 to 10 percent
Reaction—slightly acid, neutral

Bw horizon

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist

Chroma—3 to 6 dry or moist
Clay content—5 to 8 percent
Gravel content—0 to 10 percent
Mica content—0 to 5 percent
Reaction—slightly acid, neutral

2Bw horizon, or 2Bt horizon (where present)
Hue—10YR, 7.5YR
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 to 6 dry or moist
Texture—loam, sandy loam, fine sandy loam
Clay content—4 to 14 percent
Gravel content—0 to 25 percent
Paragravel content—0 to 15 percent
Total rock fragment content—0 to 25 percent
Mica content—25 to 50 percent
Reaction—moderately acid to neutral

2E and Bt horizon (where present)
Hue—10YR, 7.5YR

E part:
Texture—loam, sandy loam
Clay content—4 to 16 percent
Gravel content—0 to 25 percent
Paragravel content—0 to 15 percent
Total rock fragment content—0 to 25 percent
Mica content—25 to 50 percent
Reaction—moderately acid to neutral

Bt part:
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist

2BC horizon, or 2C horizon (where present)
Value—6 to 8 dry, 4 to 6 moist
Chroma—3 to 6 dry or moist
Texture—sandy loam, loamy coarse sand
Clay content—2 to 8 percent
Gravel content—0 to 30 percent
Paragravel content—0 to 50 percent
Total rock fragment content—10 to 30 percent
Mica content—40 to 65 percent, by volume
Reaction—moderately acid to neutral

Narcisse Series

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Treads of drainageways
Parent material: Alluvium mixed with loess and volcanic ash in the upper part
Slope range: 0 to 8 percent
Elevation: 1,800 to 2,500 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 46 to 48 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Coarse-loamy, mixed, superactive, mesic Cumulic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 8 inches; dark gray (10YR 4/1) silt loam, black (10YR 2/1) moist; moderate fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine roots; many very fine and fine tubular and irregular pores; slightly acid; clear smooth boundary.

A2—8 to 14 inches; dark grayish brown (10YR 4/2) silt loam, dark brown (10YR 2/2) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many fine roots; many very fine and fine tubular and irregular pores; neutral; abrupt smooth boundary.

A3—14 to 25 inches; dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; many fine roots; many very fine and fine tubular and irregular pores; neutral; clear wavy boundary.

AB—25 to 34 inches; brown (10YR 5/3) very fine sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many fine roots; many very fine and fine tubular and irregular pores; few fine distinct masses of iron and manganese accumulation that are brown (7.5YR 4/4) moist; neutral; clear wavy boundary.

Bw—34 to 48 inches; brown (10YR 5/3) sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine roots; common very fine and fine irregular pores; few fine distinct masses of iron and manganese accumulation that are brown (7.5YR 4/4) moist; neutral; abrupt wavy boundary.

C—48 to 60 inches; brown (10YR 5/3) sandy loam, dark brown (10YR 3/3) moist; massive; soft, very friable, nonsticky and nonplastic; common fine roots; common very fine and fine irregular pores; few fine distinct masses of iron and manganese accumulation that are brown (7.5YR 4/4) moist; neutral.

Typical Pedon Location

Map unit in which located: Narcisse silt loam, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 2.5 miles south of Veradale, Washington; about 1,800 feet north and 725 feet west of the southeast corner of section 35, T. 25 N., R. 44 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—20 to 40 inches or more
Depth to apparent water table—34 to 48 inches in February through March
Depth to redoximorphic features—20 to 40 inches
Clay content in particle-size control section—7 to 11 percent
Reaction—slightly acid, neutral

A horizon

Value—3 to 5 dry, 2 or 3 moist
Chroma—1 or 2 dry or moist
Texture—silt loam in upper part, silt loam or loam in lower part
Clay content—10 to 16 percent
Gravel content—0 to 10 percent

An Ap horizon is in some pedons.

AB horizon (where present)
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—silt loam, loam, very fine sandy loam
Clay content—4 to 8 percent
Gravel content—0 to 10 percent

Bw horizon
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam
Clay content—2 to 7 percent
Gravel content—0 to 14 percent

C horizon (where present)
Value—5 to 7 dry, 3 to 6 moist
Chroma—2 to 4 dry or moist
Texture—loam, sandy loam, fine sandy loam
Clay content—2 to 7 percent
Gravel content—0 to 14 percent
Redoximorphic features—few fine faint to many medium distinct

Nez Perce Taxadjunct

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Summits and footslopes of loess hills on basalt plateaus
Parent material: Loess with an influence of volcanic ash over older loess
Slope range: 0 to 8 percent
Elevation: 2,340 to 2,700 feet
Average annual precipitation: 18 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine, mixed, superactive, mesic Xeric Argialbolls

Taxadjunct Features

The Nez Perce soils in this survey area are a taxadjunct to the series because they do not have smectitic mineralogy. This difference, however, does not significantly affect the use, management, or interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 6 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; moderate coarse granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; many fine irregular pores and few medium tubular pores; slightly acid; clear smooth boundary.

Ap2—6 to 10 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; moderate medium platy structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; many fine irregular pores and few medium tubular pores; slightly acid; abrupt smooth boundary.

E—10 to 19 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak very coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; common fine irregular pores; 3 percent rounded gravel; neutral; gradual smooth boundary.

Btb—19 to 30 inches; light brown (7.5YR 6/3) silty clay, brown (7.5YR 4/3) moist; strong very coarse prismatic structure; extremely hard, very firm, very sticky and very plastic; common fine and very fine roots between peds; common fine irregular pores; 85 percent distinct clay films that are dark yellowish brown (10YR 3/4) moist and on faces of peds; 1 percent fine spherical black (10YR 2/1) iron-manganese concretions; neutral; E horizon material tongues into coarse prisms of horizon; gradual smooth boundary.

Btkb1—30 to 42 inches; pale brown (10YR 6/3) silty clay, brown (10YR 4/3) moist; strong coarse and medium prismatic structure; extremely hard, very firm, very sticky and very plastic; few very fine roots; common fine irregular pores; 80 percent distinct clay films that are dark yellowish brown (10YR 3/4) moist and on faces of peds; 10 percent medium spherical black (10YR 2/1) iron-manganese concretions; 10 percent fine carbonate concretions; moderately alkaline; noneffervescent; gradual smooth boundary.

Btkb2—42 to 60 inches; pale brown (10YR 6/3) silty clay, brown (10YR 4/3) moist; moderate medium prismatic structure parting to moderate medium subangular blocky; extremely hard, very firm, very sticky and very plastic; few very fine roots; common fine irregular pores; 80 percent distinct clay films that are dark yellowish brown (10YR 3/4) moist and on faces of peds; 10 percent medium spherical black (10YR 2/1) iron-manganese concretions; 10 percent fine carbonate concretions; moderately alkaline; noneffervescent.

Typical Pedon Location

Map unit in which located: Nez Perce ashy silt loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 2 miles northeast of the town of Millwood, Washington; about 2,400 feet west and 2,400 feet north of the southeast corner of section 28, T. 26 N., R. 44 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 18 inches

Depth to argillic horizon that perches water—16 to 26 inches

Thickness of volcanic ash influence—10 to 18 inches

Depth to perched water table—10 to 18 inches in April, more than 10 inches in December through March

Depth to redoximorphic features—10 to 24 inches

Depth to albic horizon—10 to 18 inches

Depth to secondary calcium carbonates—30 to 38 inches

A horizon

Value—4 or 5 dry, 2 or 3 moist

Chroma—2 or 3 dry or moist

Clay content—10 to 20 percent

Reaction—slightly acid, neutral

E horizon

Value—6 or 7 dry, 4 or 5 moist

Clay content—13 to 18 percent

Gravel content—0 to 10 percent
Reaction—slightly acid, neutral

Btb horizon
Hue—7.5YR, 10YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—silty clay, silty clay loam
Clay content—35 to 55 percent
Gravel content—0 to 5 percent
Reaction—neutral, slightly alkaline

Btkb horizon
Hue—7.5YR, 10YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—silty clay, silty clay loam, clay
Clay content—35 to 60 percent
Gravel content—0 to 5 percent
Reaction—slightly alkaline to strongly alkaline

Northstar Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Summits, shoulders, footslopes, and backslopes of basalt plateaus
Parent material: Loess with an influence of volcanic ash over colluvium and residuum derived from basalt
Slope range: 0 to 30 percent
Elevation: 1,800 to 2,550 feet
Average annual precipitation: 15 to 19 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Loamy-skeletal, mixed, superactive, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed pine needles and cones.
Oe—1 to 3 inches; partially decomposed needles and twigs.
A1—3 to 6 inches; dark gray (10YR 4/1) extremely cobbly ashy loam, black (10YR 2/1) moist; moderate medium granular structure; slightly hard, very friable, nonsticky and nonplastic; few fine and common very fine roots; common very fine irregular and tubular pores; 25 percent gravel and 45 percent cobbles; moderately acid; clear wavy boundary.
A2—6 to 11 inches; grayish brown (10YR 5/2) extremely cobbly ashy loam, very dark gray (10YR 3/1) moist; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few fine and common very fine and medium roots; few fine and medium irregular pores and common very fine tubular pores; 25 percent gravel and 40 percent cobbles; moderately acid; clear smooth boundary.
BA—11 to 17 inches; brown (10YR 5/3) very gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few fine and common very fine,

medium, and coarse roots; few fine and common very fine tubular pores; 35 percent gravel and 15 percent cobbles; slightly acid; clear smooth boundary.

2Bw—17 to 26 inches; light yellowish brown (10YR 6/4) extremely gravelly loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; moderately hard, very friable, nonsticky and slightly plastic; few fine and common very fine and medium roots; few fine and common very fine tubular and irregular pores; 40 percent gravel and 20 percent cobbles; neutral; abrupt wavy boundary.

2R—26 inches; indurated basalt.

Typical Pedon Location

Map unit in which located: Northstar-Rock outcrop-Rockly complex, 0 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 2.5 miles east of Airway Heights, Washington; about 2,250 feet south and 2,350 feet east of the northwest corner of section 20, T. 25 N., R. 42 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—7 to 17 inches
Depth to bedrock—20 to 40 inches (lithic)

A horizon

Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—7 to 12 percent
Gravel content—20 to 30 percent
Cobble content—40 to 60 percent
Total rock fragment content—60 to 80 percent
Reaction—moderately acid, slightly acid

BA and Bw horizons (where present)

Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 dry or moist
Clay content—10 to 15 percent
Gravel content—25 to 40 percent
Cobble content—10 to 35 percent
Total rock fragment content—35 to 75 percent
Reaction—slightly acid

2Bw horizon

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—10 to 15 percent
Gravel content—20 to 55 percent
Cobble content—15 to 35 percent
Total rock fragment content—50 to 85 percent
Reaction—slightly acid, neutral

2C horizon (where present)

Texture—loam, sandy loam
Total rock fragment content—60 to 80 percent

Opportunity Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Risers and treads of outwash plains
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 15 percent
Elevation: 1,800 to 2,200 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, isotic, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 7 inches; very dark grayish brown (10YR 3/2) very gravelly ashy loam, black (10YR 2/1) moist; moderate fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and few fine, medium, and coarse roots; common very fine tubular and irregular pores; 50 percent gravel; strongly acid; abrupt smooth boundary.

A1—7 to 13 inches; dark grayish brown (10YR 4/2) extremely gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine roots; common very fine irregular pores and few very fine tubular pores; 60 percent gravel; moderately acid; clear smooth boundary.

A2—13 to 19 inches; brown (10YR 5/3) extremely gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine irregular pores and few very fine tubular pores; 60 percent gravel; moderately acid; clear smooth boundary.

Bw1—19 to 33 inches; yellowish brown (10YR 5/4) extremely gravelly loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine roots; common very fine irregular and tubular pores; 55 percent gravel and 5 percent cobbles; slightly acid; clear wavy boundary.

Bw2—33 to 43 inches; brown (10YR 5/4) extremely gravelly loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine roots; few fine and common very fine and medium irregular pores; 50 percent gravel and 15 percent cobbles; slightly acid; clear wavy boundary.

Bq—43 to 53 inches; pale brown (10YR 6/3) extremely gravelly loamy coarse sand, brown (10YR 4/3) moist; single grain; soft, very friable, nonsticky and nonplastic; common very fine roots; few fine and common very fine, medium, and coarse interstitial pores; 2 percent distinct silica accumulations that are white (10YR 8/1) moist and on underside of rock fragments; 60 percent gravel and 15 percent cobbles; neutral; clear wavy boundary.

BCk—53 to 60 inches; multicolored; extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine and common very fine, medium, and coarse interstitial pores; 3 percent prominent carbonate coatings that are white (10YR 8/1) moist and on underside of rock fragments; violently effervescent; 65 percent gravel and 15 percent cobbles; slightly alkaline.

Typical Pedon Location

Map unit in which located: Opportunity very gravelly ashy loam, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 3 miles east of Otis Orchards, Washington; about 1,950 feet north and 1,300 feet east of the southwest corner of section 6, T. 25 N., R. 46 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 20 inches
Thickness of cambic horizon—20 to 30 inches
Thickness of volcanic ash influence—10 to 20 inches
Depth to secondary carbonates—44 to 60 inches or more
Depth to sandy-skeletal horizons—36 to 60 inches

Some pedons have a very stony surface.

Ap horizon (where present)
Value—3 or 4 dry, 2 or 3 moist
Chroma—2 or 3 dry, 1 or 2 moist
Clay content—8 to 12 percent
Gravel content—35 to 60 percent
Cobble content—0 to 5 percent
Total rock fragment content—35 to 60 percent
Reaction—strongly acid to slightly acid

A horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry, 1 or 2 moist
Clay content—8 to 12 percent
Gravel content—40 to 65 percent
Cobble content—0 to 10 percent
Total rock fragment content—40 to 75 percent
Reaction—moderately acid to neutral

Bw horizon
Value—5 to 7 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam
Clay content—6 to 10 percent
Gravel content—40 to 75 percent
Cobble content—0 to 15 percent
Total rock fragment content—40 to 80 percent
Reaction—slightly acid, neutral

Bq horizon
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy coarse sand, coarse sandy loam
Clay content—0 to 5 percent
Gravel content—40 to 75 percent
Cobble content—0 to 15 percent
Total rock fragment content—40 to 85 percent
Reaction—slightly acid, neutral

BCk horizon
Hue—10YR, multicolored
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—coarse sand, loamy coarse sand
Clay content—0 to 5 percent
Gravel content—55 to 75 percent
Cobble content—5 to 30 percent
Stone content—0 to 5 percent
Total rock fragment content—60 to 90 percent
Reaction—neutral, slightly alkaline
Content of calcium carbonate and silica coatings—2 to 25 percent on underside of rock fragments in some pedons

Peone Series

Depth class: Very deep
Drainage class: Poorly drained
Position on landscape: Flood plains, drainageways, depressions
Parent material: Alluvium mixed with volcanic ash and loess in the upper part
Slope range: 0 to 3 percent
Elevation: 1,540 to 2,500 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 46 to 48 degrees F
Frost-free period: 80 to 130 days

Taxonomic class: Ashy, glassy, nonacid, mesic Aquandic Endoaquepts (fig. 29)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 6 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; moderate thin platy structure parting to moderate medium granular; slightly hard, friable, slightly sticky and slightly plastic; common fine roots; many very fine and fine irregular and tubular pores; slightly acid; abrupt smooth boundary.

Bw—6 to 11 inches; light brownish gray (10YR 6/2) ashy silt loam, dark grayish brown (10YR 4/2) moist; moderate thin platy structure parting to moderate medium granular; slightly hard, friable, slightly sticky and slightly plastic; common fine roots; common very fine and fine irregular pores; neutral; abrupt smooth boundary.

Bg1—11 to 30 inches; gray (10YR 6/1) ashy silt loam, dark gray (10YR 4/1) moist; massive; hard, friable, slightly sticky and slightly plastic; few fine roots; common very fine and fine irregular pores; 20 percent medium distinct masses of iron and manganese accumulation that are strong brown (7.5YR 5/6), brown (7.5YR 4/4) moist; neutral; clear wavy boundary.

Bg2—30 to 42 inches; light gray (2.5Y 7/2) ashy very fine sandy loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, friable, nonsticky and nonplastic; few roots; common very fine and fine irregular pores; 20 percent medium distinct masses of iron and manganese accumulation that are strong brown (7.5YR 5/6), brown (7.5YR 4/4) moist; slightly acid; clear wavy boundary.

2Cg—42 to 60 inches; light gray (2.5Y 7/2) loamy coarse sand, grayish brown (2.5Y 5/2) moist; massive; soft, friable; 20 percent medium prominent masses of iron and manganese accumulation that are strong brown (7.5YR 5/6), brown (7.5YR 4/4) moist; common very fine and fine irregular pores; moderately acid.

Figure 29.—Typical profile of a Peone soil.

Typical Pedon Location

Map unit in which located: Peone-Saltese complex, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 2 miles southwest of Peone, Washington; about 340 feet west and 2,200 feet south of the northeast corner of section 5, T. 26 N., R. 44 E.

Range in Characteristics

Profile

Depth of volcanic ash influence mixed with loess—20 to 30 inches
Depth to apparent water table—10 to 20 inches in February through May, more than 20 inches in June through January
Depth to redoximorphic features—10 to 20 inches
Depth to sandy material—40 to 60 inches or more

A horizon

Hue—10YR, 2.5Y
Value—5 or 6 dry, 2 to 4 moist
Chroma—1 or 2 dry or moist

Clay content—15 to 22 percent
Reaction—slightly acid, neutral

Bw horizon
Hue—10YR, 2.5Y
Value—5 to 7 dry, 4 to 5 moist
Chroma—1 to 3 dry or moist
Texture—ashy silt loam, ashy very fine sandy loam
Clay content—10 to 20 percent
Reaction—slightly acid, neutral

Bg horizon
Hue—10YR, 2.5Y
Value—5 to 8 dry, 4 to 6 moist
Chroma—1 or 2 dry or moist
Texture—ashy silt loam, ashy very fine sandy loam
Clay content—6 to 20 percent
Reaction—slightly acid, neutral

Strata of pumicite, diatomite, or volcanic ash in some pedons.

2Cg horizon
Hue—10YR, 2.5Y, 5Y
Value—5 to 8 dry, 4 to 6 moist
Chroma—1 or 2 dry or moist
Texture—loamy coarse sand with thin strata of silt loam, very fine sandy loam, fine sandy loam, or sandy loam
Clay content—4 to 8 percent
Reaction—moderately acid to neutral

Phoebe Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash plains
Parent material: Sandy glaciofluvial deposits mixed with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 15 percent
Elevation: 1,700 to 2,500 feet
Average annual precipitation: 15 to 23 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Coarse-loamy, mixed, superactive, mesic Vitrandic Haploxerolls (fig. 30)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 8 inches; dark gray (10YR 4/1) ashy sandy loam, black (10YR 2/1) moist; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; few fine tubular and irregular pores; slightly acid; abrupt smooth boundary.
A—8 to 16 inches; dark grayish brown (10YR 4/2) ashy sandy loam, very dark brown (10YR 2/2) moist; weak medium granular structure; soft, very friable, slightly sticky and slightly plastic; many fine roots; many fine irregular pores; slightly acid; clear wavy boundary.

Figure 30.—Typical profile of a Phoebe soil. Numerals on tape indicate centimeters.

Bw1—16 to 25 inches; brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common fine roots; many fine irregular pores; neutral; gradual wavy boundary.

Bw2—25 to 34 inches; light yellowish brown (10YR 6/4) sandy loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common fine roots; many fine irregular pores; neutral; gradual wavy boundary.

C1—34 to 44 inches; light yellowish brown (10YR 6/4) loamy sand, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic;

common fine roots; common fine interstitial pores; neutral; gradual wavy boundary.
C2—44 to 60 inches; very pale brown (10YR 7/4) sand, yellowish brown (10YR 5/4) moist; single grain; loose; few fine roots; common fine interstitial pores; neutral.

Typical Pedon Location

Map unit in which located: Phoebe ashy sandy loam, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 3.5 miles northwest of Colbert, Washington; about 2,500 feet east and 1,050 feet north of the southwest corner of section 7, T. 27 N., R. 43 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—20 to 30 inches
Thickness of volcanic ash influence—12 to 20 inches
Clay content in particle-size control section—5 to 15 percent
Total rock fragment content in particle-size control section—0 to 10 percent
Reaction—slightly acid, neutral

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—5 to 15 percent
Gravel content—0 to 5 percent

Bw1 horizon
Value—4 to 5 dry, 2 or 3 moist
Chroma—2 to 4 dry or moist
Texture—fine sandy loam, sandy loam
Clay content—5 to 15 percent
Gravel content—0 to 5 percent

Bw2 horizon
Value—4 to 7 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—fine sandy loam, sandy loam
Clay content—5 to 15 percent
Gravel content—0 to 5 percent

C horizon
Hue—10YR, 2.5Y
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—loamy sand, sand
Clay content—1 to 8 percent
Gravel content—0 to 10 percent

Pinecreek Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes of mountains
Parent material: Thick volcanic ash mantle over colluvium and residuum derived from siltite and fine-grained quartzite

Slope range: 20 to 75 percent
Elevation: 2,210 to 4,450 feet
Average annual precipitation: 23 to 51 inches
Average annual air temperature: 44 to 46 degrees F
Frost-free period: 95 to 125 days

Taxonomic class: Ashy over loamy-skeletal, glassy over isotic, frigid Humic Vitrixerands

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material consisting of needles, leaves, bark, twigs, and cones.

Oe—1 to 2 inches; moderately decomposed plant material mixed with 1980's Mount St. Helens volcanic ash.

A1—2 to 6 inches; brown (10YR 4/3) gravelly ashy silt loam, very dark brown (10YR 2/2) moist; weak very fine and fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine tubular pores; 20 percent gravel; neutral; abrupt wavy boundary.

A2—6 to 12 inches; brown (10YR 5/3) gravelly ashy silt loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine tubular pores; 25 percent gravel; neutral; clear wavy boundary.

Bw1—12 to 19 inches; light yellowish brown (10YR 6/4) gravelly ashy silt loam, dark yellowish brown (10YR 3/4) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine and few medium tubular pores; 20 percent gravel and 10 percent channers; slightly acid; gradual wavy boundary.

Bw2—19 to 24 inches; light yellowish brown (10YR 6/4) gravelly ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine and fine and few medium tubular pores; 25 percent gravel and 5 percent channers; slightly acid; abrupt wavy boundary.

2Bw3—24 to 30 inches; very pale brown (10YR 7/4) very gravelly loam, dark yellowish brown (10YR 4/4) moist; weak medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine and common medium tubular pores; 40 percent gravel and 5 percent channers; moderately acid; gradual wavy boundary.

2C1—30 to 39 inches; light yellowish brown (10YR 6/4) extremely flaggy loam, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine and common medium tubular pores; 35 percent gravel, 10 percent cobbles, and 20 percent flagstones; moderately acid; gradual wavy boundary.

2C2—39 to 59 inches; very pale brown (10YR 7/4) extremely cobbly loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; many very fine and fine and

common medium tubular pores; 35 percent gravel, 30 percent cobbles, and 5 percent stones; moderately acid; gradual wavy boundary.

2C3—59 to 70 inches; very pale brown (10YR 7/4) extremely gravelly loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; many very fine and fine and common medium tubular pores; 55 percent gravel and 10 percent cobbles; strongly acid.

Typical Pedon Location

Map unit in which located: Pinecreek gravelly ashy silt loam, moist, 35 to 65 percent slopes

Location in survey area: Benewah County, Idaho, about 2.75 miles southwest of St. Maries, Idaho; about 50 feet north and 1,670 feet east of the southwest corner of section 32, T. 46 N., R. 2 W.

Range in Characteristics

Profile

Thickness of umbric epipedon—10 to 15 inches
Thickness of volcanic ash mantle—14 to 22 inches

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam
Clay content—3 to 8 percent
Gravel content—5 to 30 percent
Total rock fragment content—5 to 30 percent
Reaction—slightly acid, neutral

Bw horizon

Value—5 or 6 dry, 3 or 4 moist
Texture—ashy silt loam
Clay content—3 to 8 percent
Gravel content—5 to 25 percent
Channer content—0 to 10 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 30 percent
Reaction—slightly acid, neutral

2Bw horizon

Value—6 or 7 dry, 4 or 5 moist
Texture—loam, silt loam
Clay content—3 to 10 percent
Gravel content—25 to 50 percent
Cobble content—0 to 25 percent
Channer content—0 to 10 percent
Total rock fragment content—40 to 65 percent
Reaction—moderately acid, slightly acid

2C horizon

Value—6 or 7 dry, 4 or 5 moist
Texture—loam, sandy loam, silt loam
Clay content—3 to 10 percent
Gravel content—30 to 60 percent
Cobble content—10 to 40 percent
Stone content—0 to 20 percent

Flagstone content—0 to 20 percent
Total rock fragment content—65 to 85 percent
Reaction—strongly acid to slightly acid

Pywell Series

Depth class: Very deep
Drainage class: Very poorly drained
Position on landscape: Treads of drainageways and flood plains
Parent material: Decomposed herbaceous and woody material mixed with a minor amount of mineral material
Slope range: 0 to 2 percent
Elevation: 1,820 to 2,190 feet
Average annual precipitation: 20 to 25 inches
Average annual air temperature: 42 to 44 degrees F
Frost-free period: 80 to 110 days

Taxonomic class: Euic, frigid Typic Haplosaprists

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oa1—0 to 6 inches; black (10YR 2/1) herbaceous muck (highly decomposed plant material) broken face and rubbed, very dark grayish brown (10YR 3/2) dry; about 10 percent fiber, 5 percent rubbed; weak fine granular structure; nonsticky and nonplastic; many very fine and fine roots; very strongly acid; clear wavy boundary.

Oa2—6 to 14 inches; very dark brown (10YR 2/2) muck (highly decomposed plant material) broken face, very dark brown (10YR 2/2) rubbed, dark brown (10YR 3/3) dry; about 20 percent fiber, 2 percent rubbed; moderate medium subangular blocky structure; nonsticky and nonplastic; many very fine and fine and few medium roots; thin volcanic ash lens at bottom of horizon; very strongly acid; abrupt wavy boundary.

Oa3—14 to 27 inches; dark brown (10YR 3/3) muck (highly decomposed plant material) broken face, dark brown (7.5YR 3/2) rubbed, brown (10YR 5/3) dry; about 25 percent fiber, 2 percent rubbed; 20 percent volcanic ash; moderate thick platy structure; nonsticky and nonplastic; many very fine and fine roots; 2 percent dark yellowish brown (10YR 4/6) and 5 percent brownish yellow (10YR 6/8) masses of oxidized iron; very strongly acid; abrupt wavy boundary.

Oe—27 to 31 inches; dark brown (10YR 3/3) mucky peat (moderately decomposed plant material) broken face, very dark brown (10YR 2/2) rubbed, dark yellowish brown (10YR 4/4) dry; about 75 percent fiber, 35 percent rubbed; massive; nonsticky and nonplastic; few very fine roots; light brownish gray (10YR 6/2) iron depletions; very strongly acid; gradual wavy boundary.

Oa4—31 to 45 inches; dark yellowish brown (10YR 4/6) muck (highly decomposed plant material) broken face, very dark grayish brown (10YR 3/2) rubbed, dark grayish brown (10YR 4/2) dry; about 30 percent fiber, 15 percent rubbed; massive; nonsticky and nonplastic; few very fine roots; very strongly acid; gradual wavy boundary.

Oa5—45 to 60 inches; dark yellowish brown (10YR 4/4) muck (highly decomposed plant material) broken face, very dark grayish brown (10YR 3/2) rubbed and dry; about 20 percent fiber, 5 percent rubbed; massive; nonsticky and nonplastic; few very fine roots; moderately acid.

Typical Pedon Location

Map unit in which located: Pywell-Bellslake complex, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 3 miles north of Moab, Washington; about 1,800 feet west and 1,800 feet north of the southeast corner of section 11, T. 26 N., R. 45 E.

Range in Characteristics

Profile
Thickness of organic material—50 to 60 inches or more
Depth to apparent water table—soil surface to a depth of 6 inches in January through June, more than 6 inches in July through December

Some pedons contain discontinuous layers of limnic material mixed with volcanic ash and diatoms.

Oa horizon
Hue—10YR, 7.5YR
Value—2 to 4 moist, 3 to 5 dry
Chroma—1 to 3 moist, 2 to 6 dry
Unrubbed fiber content—10 to 50 percent
Rubbed fiber content—2 to 15 percent
Reaction—very strongly acid to moderately acid

The Oa horizon may have thin lenses of volcanic ash or other mineral soil material in the upper part.

Oe horizon (where present)
Value—2 to 4 moist
Chroma—1 to 4 moist
Unrubbed fiber content—60 to 75 percent
Rubbed fiber content—35 to 45 percent
Reaction—very strongly acid to moderately acid

Quinnamose Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes of mountains and hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from granite and schist
Slope range: 15 to 55 percent
Elevation: 2,000 to 3,800 feet
Average annual precipitation: 22 to 35 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Coarse-loamy, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, leaves, and twigs.
Oe—1 to 3 inches; moderately decomposed plant material.
A—3 to 9 inches; grayish brown (10YR 5/2) ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; soft, friable, slightly

sticky and slightly plastic; many very fine, fine, and medium roots; many very fine and fine tubular and irregular pores; 1 percent fine mica flakes; 2 percent gravel; slightly acid; clear wavy boundary.

BA—9 to 12 inches; pale brown (10YR 6/3) ashy sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; many very fine and fine tubular and irregular pores; 2 percent fine mica flakes; 5 percent gravel; neutral; clear wavy boundary.

Bw1—12 to 31 inches; pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine, medium, and coarse roots; common very fine and fine tubular and irregular pores; 5 percent fine mica flakes; 5 percent paragravel and 5 percent gravel; slightly acid; gradual wavy boundary.

Bw2—31 to 51 inches; pale brown (10YR 6/3) paragravelly sandy loam, brown (10YR 4/3) moist; weak medium and coarse subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine, fine, and medium roots; common very fine and fine irregular pores; 20 percent fine mica flakes; 15 percent paragravel and 10 percent gravel; slightly acid; gradual wavy boundary.

BC—51 to 58 inches; light yellowish brown (2.5Y 6/3) very paragravelly sandy loam, olive brown (2.5Y 4/3) moist; weak coarse subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine, fine, and medium roots; many very fine and fine irregular pores; 25 percent fine and medium mica flakes; 25 percent paragravel and 10 percent gravel; slightly acid; gradual wavy boundary.

Cr—58 inches; highly weathered micaceous schist; weakly cemented or moderately cemented.

Typical Pedon Location

Map unit in which located: Quinnamose-Micapeak complex, 30 to 55 percent slopes

Location in survey area: Spokane County, Washington, about 2 miles northeast of Freeman, Washington; about 1,040 feet east and 1,665 feet south of the northwest corner of section 32, T. 24 N., R. 45 E.

Range in Characteristics

Profile

Depth to bedrock—40 to 60 inches (paralithic)
Thickness of volcanic ash influence—8 to 14 inches
Clay content in particle-size control section—8 to 18 percent

A horizon

Value—5 or 6 dry, 2 to 4 moist
Chroma—2 or 3 dry or moist
Clay content—8 to 12 percent
Gravel content—0 to 10 percent
Mica content—0 to 5 percent
Reaction—moderately acid, slightly acid

BA horizon

Value—5 or 6 dry, 2 to 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy loam, ashy sandy loam
Clay content—8 to 14 percent
Gravel content—5 to 20 percent
Mica content—2 to 5 percent
Reaction—moderately acid to neutral

Bw horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, loam
Clay content—8 to 18 percent
Gravel content—5 to 15 percent in upper part, 10 to 20 percent in lower part
Paragravel content—0 to 15 percent
Total rock fragment content—averages less than 35 percent
Mica content—5 to 25 percent
Reaction—moderately acid to neutral

BC horizon
Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, loam
Clay content—5 to 10 percent
Gravel content—5 to 20 percent
Paragravel content—5 to 25 percent
Total rock fragment content—averages less than 40 percent
Mica content—15 to 25 percent
Reaction—slightly acid, neutral

Some pedons have a C horizon above the Cr horizon.

Reardan Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits, backslopes, and footslopes of loess hills
Parent material: Recent loess over older loess
Slope range: 0 to 25 percent
Elevation: 2,200 to 2,800 feet
Average annual precipitation: 15 to 18 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine, mixed, superactive, mesic Typic Palexerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 10 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; moderate coarse subangular blocky structure; moderately hard, friable, nonsticky and slightly plastic; many very fine roots throughout; common very fine irregular pores; moderately acid; clear wavy boundary.
Bw—10 to 15 inches; brown (10YR 4/3) silt loam, dark brown (10YR 3/3) moist; moderate coarse subangular blocky structure; moderately hard, friable, nonsticky and slightly plastic; many very fine roots throughout; many very fine and common fine irregular pores; slightly acid; clear wavy boundary.
E—15 to 18 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine roots throughout; many very fine and common fine irregular pores; neutral; abrupt smooth boundary.
Btb—18 to 31 inches; dark yellowish brown (10YR 4/4) silty clay, dark yellowish brown (10YR 3/4) moist; strong medium prismatic structure parting to moderate medium

subangular blocky; very hard, very firm, very sticky and very plastic; many very fine roots between peds; common very fine irregular pores; 40 percent clay films and 40 percent pressure faces on faces of peds; 2 percent fine black (10YR 2/1) iron-manganese nodules with sharp boundaries in matrix; neutral; clear wavy boundary.

Btkb—31 to 37 inches; dark yellowish brown (10YR 4/4) silty clay loam, dark yellowish brown (10YR 3/6) moist; weak coarse prismatic structure parting to strong medium subangular blocky; hard, firm, very sticky and very plastic; common very fine roots between peds; common very fine and fine irregular pores; 20 percent clay films and 60 percent pressure faces on faces of peds; 2 percent fine black (10YR 2/1) iron-manganese nodules with sharp boundaries in matrix; 5 percent medium white (10YR 8/1) carbonate masses in matrix; neutral, clear wavy boundary.

Bkqb—37 to 60 inches; dark yellowish brown (10YR 4/6) silt loam, dark yellowish brown (10YR 3/6) moist; weak coarse prismatic structure parting to strong medium subangular blocky; moderately hard, friable, moderately sticky and moderately plastic; extremely weakly cemented with silica; common very fine and fine irregular pores; 70 percent pressure faces on faces of peds; 2 percent fine black (10YR 2/1) iron-manganese nodules with sharp boundaries in matrix; 10 percent extremely coarse white (10YR 8/1) carbonate masses on vertical faces of prisms; 70 percent medium extremely weakly cemented durinodes throughout; slightly alkaline.

Typical Pedon Location

Map unit in which located: Reardan silt loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington; about 2,000 feet north and 440 feet west of the southeast corner of section 29, T. 24 N., R. 40 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 20 inches
Depth to argillic horizon—12 to 19 inches
Depth to secondary carbonates—20 to 40 inches
Depth to durinodes—31 to 60 inches
Clay content in particle-size control section—35 to 45 percent

Ap and A horizons

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry, 1 to 3 moist
Clay content—15 to 25 percent
Reaction—moderately acid to neutral

Bw horizon

Value—4 or 5 dry, 3 or 4 moist
Chroma—2 to 3 dry or moist
Clay content—15 to 25 percent
Reaction—slightly acid, neutral

E horizon, or BE horizon (where present)

Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—12 to 20 percent
Reaction—slightly acid, neutral

Btb horizon

Hue—7.5YR, 10YR
Value—4 to 6 dry, 3 to 6 moist

Chroma—3 to 6 dry, 3 or 4 moist
Texture—silty clay loam, silty clay, clay
Clay content—35 to 45 percent
Reaction—neutral, slightly alkaline

Btkb horizon
Hue—7.5YR, 10YR
Value—4 to 6 dry, 3 to 6 moist
Chroma—3 to 6 dry, 3 or 4 moist
Texture—silty clay loam, silty clay, clay
Clay content—35 to 45 percent
Carbonate masses—2 to 25 percent
Durinode content—0 to 75 percent; fine to medium, extremely weakly cemented to moderately cemented
Reaction—neutral to moderately alkaline

Bkqb horizon
Hue—7.5YR, 10YR
Value—4 to 6 dry, 3 to 6 moist
Chroma—3 to 6 dry, 3 or 4 moist
Texture—silt loam, silty clay loam
Clay content—15 to 30 percent
Gravel content—0 to 10 percent
Carbonate masses—2 to 25 percent
Durinode content—30 to 90 percent; fine to medium, extremely weakly cemented to moderately cemented
Reaction—neutral to moderately alkaline

Some pedons have a BE horizon. A weakly developed duripan is below a depth of 43 inches in some pedons.

Rockly Series

Depth class: Very shallow
Drainage class: Well drained
Position on landscape: Summits on basalt plateaus of channeled scablands
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum
Slope range: 0 to 35 percent
Elevation: 1,820 to 2,600 feet
Average annual precipitation: 15 to 20 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Loamy-skeletal, mixed, superactive, mesic Lithic Haploxerolls (fig. 31)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 3 inches; brown (10YR 5/3) very cobbly loam, dark brown (10YR 3/3) moist; moderate very thick platy structure; slightly hard, very friable, slightly sticky and nonplastic; many very fine and few medium roots; common fine and medium irregular pores and few very fine tubular pores; 20 percent gravel and 35 percent cobbles; neutral; abrupt smooth boundary.
Bw—3 to 6 inches; brown (10YR 5/3) very cobbly loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly

Figure 31.—Typical profile of a Rockly soil.

sticky and slightly plastic; common very fine and few medium roots; common very fine and fine and few medium irregular pores and common very fine tubular pores; 20 percent gravel and 35 percent cobbles; slightly acid; abrupt wavy boundary.

R—6 inches; unweathered basalt.

Typical Pedon Location

Map unit in which located: Rockly-Deno complex, 0 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 2 miles northwest of Airway Heights; about 1,450 feet north and 2,520 feet east of the southwest corner of section 10, T. 25 N., R. 41 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—4 to 12 inches

Hue—10YR, 7.5YR

Clay content—7 to 15 percent

Depth to bedrock—4 to 12 inches (lithic)

Reaction—slightly acid, neutral

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Gravel content—10 to 30 percent
Cobble content—20 to 40 percent
Total rock fragment content—35 to 60 percent

Bw horizon
Value—4 or 5 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam
Gravel content—20 to 45 percent
Cobble content—20 to 45 percent
Total rock fragment content—40 to 75 percent

The Rockly soils in this survey area are considered similar soils to the series because the clay content is less than the 20 to 30 percent that is the clay range for the series. This difference, however, does not significantly affect the use, management, and interpretation of the soils.

Saltese Series

Depth class: Very deep
Drainage class: Very poorly drained
Position on landscape: Treads on flood plains, drainageways, and depressions
Parent material: Decomposed organic herbaceous material
Slope range: 0 to 3 percent
Elevation: 1,540 to 2,500 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 46 to 48 degrees F
Frost-free period: 80 to 130 days

Taxonomic class: Euic, mesic Typic Haplosaprists

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oap—0 to 5 inches; black (7.5YR 2.5/1) herbaceous muck (highly decomposed plant material) broken face and rubbed, very dark grayish brown (10YR 3/2) dry; about 25 percent fiber, 5 percent rubbed; mostly herbaceous fiber; 40 percent mineral material; moderate medium and coarse granular structure; nonsticky and nonplastic; few very fine roots; very strongly acid; clear smooth boundary.

Oa—5 to 12 inches; black (10YR 2/1) herbaceous muck (highly decomposed plant material) broken face and rubbed, very dark gray (10YR 3/1) dry; about 20 percent fiber, 10 percent rubbed; mostly herbaceous fiber; 20 percent mineral material; weak medium and coarse subangular blocky structure; nonsticky and nonplastic; few very fine roots; very strongly acid; abrupt smooth boundary.

Oe—12 to 16 inches; dark reddish brown (5YR 2.5/2) herbaceous mucky peat (moderately decomposed plant material) broken face, black (5YR 2.5/1) rubbed, black (10YR 2/1) dry; about 50 percent fiber, 20 percent rubbed; mostly herbaceous fiber; less than 5 percent mineral material; weak medium and coarse subangular blocky structure; nonsticky and nonplastic; few very fine roots; 15 percent black (2.5YR 2.5/1) fine charcoal; very strongly acid; abrupt smooth boundary.

Oa1—16 to 24 inches; very dark grayish brown (10YR 3/2) herbaceous muck (highly decomposed plant material) broken face, very dark grayish brown (10YR 3/2) rubbed, dark gray (7.5YR 4/1) dry; about 30 percent fiber, 5 percent rubbed; mostly herbaceous fiber; less than 5 percent mineral content; weak medium and coarse subangular blocky structure; nonsticky and nonplastic; neutral; clear smooth boundary.

Oa2—24 to 40 inches; dark yellowish brown (10YR 3/6) and (10YR 4/6) herbaceous muck (highly decomposed material) broken face, dark brown (10YR 3/3) rubbed, grayish brown (10YR 5/2) dry; color changes dramatically and immediately upon exposure to air; about 30 percent fiber, 5 percent rubbed; mostly herbaceous fiber; less than 5 percent mineral material; massive; nonsticky and nonplastic; neutral; gradual smooth boundary.

Oa3—40 to 60 inches; dark yellowish brown (10YR 3/4) and (10YR 4/4) herbaceous muck (highly decomposed plant material) broken face, dark brown (10YR 3/3) rubbed, grayish brown (10YR 5/2) dry; color changes dramatically and immediately upon exposure to air; about 70 percent fiber, 5 percent rubbed; mostly herbaceous fiber; less than 5 percent mineral material; massive; nonsticky and nonplastic; neutral.

Typical Pedon Location

Map unit in which located: Saltese muck, drained, 0 to 3 percent slopes

Location in survey area: Spokane County, Washington, about 2 miles southwest of Liberty Lake, Washington; about 3,680 feet west and 770 feet north of the southeast corner of section 28, T. 25 N., R. 45 E.

Range in Characteristics

Profile

Thickness of organic material—50 to 60 inches or more

Reaction—very strongly acid to neutral

Depth to apparent water table—soil surface to a depth of 6 inches in December through May, more than 6 inches in June through November

Some pedons have discontinuous layers of limnic material mixed with volcanic ash and diatoms.

Oa horizon

Hue—5YR to 2.5Y

Value—2 to 4 moist, 2 to 5 dry

Chroma—1 to 6 moist, 1 or 2 dry

Unrubbed fiber content—5 to 30 percent

Rubbed fiber content—less than 5 to 15 percent

Oe horizon

Hue—5YR to 10YR

Value—2 to 3 moist, 2 to 4 dry

Chroma—2 to 4 dry or moist

Unrubbed fiber content—30 to 70 percent

Rubbed fiber content—5 to 25 percent

Santa Series

Depth class: Moderately deep to a fragipan

Drainage class: Moderately well drained

Position on landscape: Summits, backslopes, and footslopes of hills

Parent material: Loess with an influence of volcanic ash in the upper part

Slope range: 8 to 30 percent
Elevation: 2,310 to 3,200 feet
Average annual precipitation: 23 to 37 inches
Average annual air temperature: 41 to 46 degrees F
Frost-free period: 60 to 125 days

Taxonomic class: Coarse-silty, mixed, superactive, frigid Vitrandic Fragixeralfs (fig. 32)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 0.5 inch; slightly decomposed plant material.
Oe—0.5 to 1 inch; moderately decomposed plant material.
A1—1 to 5 inches; brown (10YR 5/3) ashy silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; slightly acid; clear smooth boundary.

Figure 32.—Typical profile of a Santa soil. Numerals on tape indicate inches.

A2—5 to 9 inches; pale brown (10YR 6/3) ashy silt loam, brown (10YR 4/3) moist; weak fine subangular blocky structure and weak medium subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; moderately acid; gradual wavy boundary.

Bw—9 to 16 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure parting to weak thin platy; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores and few fine irregular pores; strongly acid; gradual wavy boundary.

EB—16 to 25 inches; very pale brown (10YR 7/3) silt loam, brown (10YR 5/3) moist; moderate fine angular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine roots; few very fine irregular pores; 5 percent fine prominent spherical strongly cemented iron-manganese concretions that are in matrix and have sharp boundaries and 30 percent medium prominent irregular very weakly cemented masses of oxidized iron that are yellowish brown (10YR 5/6) moist, are in matrix, and have diffuse boundaries; strongly acid; abrupt wavy boundary.

E—25 to 27 inches; very pale brown (10YR 8/2) silt, light brownish gray (10YR 6/2) moist; massive; slightly hard, friable, nonsticky and slightly plastic; brittle; few very fine roots; few very fine irregular pores; 5 percent fine prominent spherical strongly cemented iron-manganese concretions that are in matrix and have sharp boundaries and 20 percent medium prominent irregular very weakly cemented masses of oxidized iron that are yellowish brown (10YR 5/4) moist, are in matrix, and have diffuse boundaries; strongly acid; abrupt irregular boundary.

Btx/Ex—27 to 39 inches; 75 percent dark yellowish brown (10YR 4/6) silty clay loam, dark yellowish brown (10YR 4/4) moist (Btx part); moderate coarse prismatic structure parting to strong medium angular blocky; extremely hard, extremely firm, moderately sticky and moderately plastic; brittle; 20 percent distinct silt coatings and 20 percent prominent organic stains on vertical faces of peds and 80 percent distinct clay films on faces of peds; 25 percent very pale brown (10YR 8/2) silt loam, pale brown (10YR 6/3) moist (Ex part); massive; extremely hard, firm, slightly sticky and slightly plastic; few very fine roots flattened between peds; common very fine and few fine irregular and vesicular pores; 5 percent fine prominent spherical strongly cemented iron-manganese concretions in matrix with sharp boundaries; moderately acid; clear wavy boundary.

Btx—39 to 65 inches; yellowish brown (10YR 5/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium prismatic structure parting to moderate medium angular blocky; extremely hard, extremely firm, moderately sticky and moderately plastic; brittle; few very fine roots between peds; few very fine and common fine irregular and vesicular pores; 20 percent faint silt coatings and 80 percent prominent clay films on all faces of peds and 50 percent prominent organic stains on vertical faces of peds; 2 percent fine prominent spherical strongly cemented iron-manganese concretions in matrix with sharp boundaries; 2 percent fine gravel; neutral.

Typical Pedon Location

Map unit in which located: Santa ashy silt loam, 8 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 7 miles east of Freeman, Washington; about 0.5 mile south of Elder Road, on Horton Road; about 1,660 feet north and 10 feet east of the southwest corner of section 6, T. 23 N., R. 46 E.

Range in Characteristics

Profile
Depth to fragipan—20 to 40 inches
Depth to bedrock—more than 60 inches
Depth to perched water table—typically 16 to 25 inches, but ranges from 8 to 22 inches in February through March
Depth to redoximorphic features—16 to 25 inches
Thickness of volcanic ash influence—7 to 12 inches

A horizon
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Clay content—10 to 18 percent
Reaction—moderately acid to neutral

Bw horizon
Hue—10YR, 7.5YR
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Clay content—12 to 18 percent
Reaction—strongly acid to slightly acid

E horizon
Hue—10YR, 2.5Y, 7.5YR
Value—6 to 8 dry, 4 to 6 moist
Chroma—2 or 3 dry or moist
Texture—silt loam, silt
Clay content—8 to 16 percent
Reaction—strongly acid to slightly acid

Btx/Ex horizon
Texture—silt loam, silty clay loam
Clay content—20 to 34 percent
Reaction—moderately acid to neutral

Btx horizon
Hue—10YR, 7.5YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—19 to 35 percent
Fine gravel content—0 to 3 percent
Reaction—slightly acid, neutral

Schumacher Series

Depth class: Deep
Drainage class: Well drained
Position on landscape: Backslopes and footslopes of hills and mountains
Parent material: Loess mixed with colluvium and residuum derived from metasedimentary rock
Slope range: 5 to 40 percent
Elevation: 2,550 to 3,500 feet
Average annual precipitation: 20 to 28 inches

Average annual air temperature: 45 to 49 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Fine-loamy, mixed, superactive, mesic Ultic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material mixed with 1980's Mount St. Helens volcanic ash.

A—1 to 8 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; moderate very fine and fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and few fine roots; 10 percent quartzite gravel; moderately alkaline; clear wavy boundary.

BA—8 to 20 inches; brown (10YR 4/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure parting to strong fine subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; 10 percent quartzite gravel; slightly acid; gradual wavy boundary.

Bt1—20 to 27 inches; brown (10YR 5/3) silt loam, brown (7.5YR 4/3) moist; moderate coarse subangular blocky structure and moderate medium subangular blocky; moderately hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; 3 percent distinct organoargillans on faces of peds; 10 percent distinct silt coatings on faces of peds; 25 percent faint clay films on faces of peds; krotovinas or pockets of buried A material throughout horizon; 10 percent quartzite gravel; slightly acid; clear wavy boundary.

Bt2—27 to 34 inches; dark yellowish brown (10YR 4/4) gravelly silt loam, dark yellowish brown (10YR 3/4) moist; moderate coarse subangular blocky structure parting to strong medium angular blocky; moderately hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; 10 percent distinct silt coatings on faces of peds; 10 percent distinct and 35 percent faint clay films on faces of peds; 15 percent quartzite gravel and 2 percent quartzite paragravel; neutral; gradual wavy boundary.

Bt3—34 to 41 inches; yellowish brown (10YR 5/4) very cobbly clay loam, dark yellowish brown (10YR 3/4) moist; moderate fine subangular blocky structure and moderate medium subangular blocky; moderately hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; 10 percent distinct and 35 percent faint clay films on faces of peds; 20 percent quartzite gravel and 25 percent quartzite cobbles; neutral; gradual wavy boundary.

Bt4—41 to 47 inches; brown (7.5YR 4/4) gravelly clay loam, brown (7.5YR 4/3) moist; moderate fine subangular blocky structure and moderate medium subangular blocky; moderately hard, friable, moderately sticky and moderately plastic; few very fine and fine roots; 3 percent distinct organoargillans; 10 percent distinct and 40 percent faint clay films on faces of peds; 25 percent quartzite gravel, 2 percent quartzite paragravel, and 5 percent strongly cemented quartzite cobbles; neutral; abrupt wavy boundary.

R—47 inches; metasedimentary rock.

Typical Pedon Location

Map unit in which located: Schumacher-Tekoa complex, 25 to 45 percent slopes
Location in survey area: Benewah County, Idaho, about 4.5 miles west of the town of Tensed, Idaho; about 970 feet north and 2,075 feet east of the southwest corner of section 7, T. 44 N., R. 5 W.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 19 inches
Depth to bedrock—40 to 60 inches (lithic)

A horizon
Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 or 2 dry or moist
Clay content—15 to 24 percent
Gravel content—0 to 10 percent
Reaction—neutral, slightly alkaline

BA horizon
Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—silt loam
Clay content—17 to 25 percent
Gravel content—0 to 10 percent
Reaction—slightly acid to slightly alkaline

Bt1 and Bt2 horizons
Hue—10YR, 7.5YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—20 to 29 percent
Gravel content—0 to 25 percent
Reaction—slightly acid to slightly alkaline

Bt3 and Bt4 horizons
Hue—10YR, 7.5YR
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—clay loam, silty clay loam, silt loam
Clay content—24 to 30 percent
Gravel content—15 to 30 percent
Cobble content—5 to 25 percent
Total rock fragment content—20 to 45 percent
Reaction—slightly acid to slightly alkaline

Scoap Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes of escarpments
Parent material: Outwash deposits mixed with loess and a minor amount of volcanic ash in the upper part
Slope range: 30 to 60 percent
Elevation: 1,540 to 2,400 feet
Average annual precipitation: 18 to 23 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Loamy-skeletal, isotic, frigid Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material.
A1—1 to 7 inches; dark grayish brown (10YR 4/2) gravelly ashy sandy loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and few fine roots; many very fine interstitial pores; 30 percent gravel; slightly acid; abrupt smooth boundary
A2—7 to 17 inches; grayish brown (10YR 5/2) very gravelly ashy sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and few fine, medium, and coarse roots; few fine and medium dendritic tubular pores and many very fine interstitial pores; 40 percent gravel; slightly acid; clear smooth boundary
Bw—17 to 30 inches; brown (10YR 5/3) very gravelly sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine and medium roots; few fine dendritic tubular pores and many very fine interstitial pores; 50 percent gravel and 5 percent cobbles; slightly acid; gradual smooth boundary
BC—30 to 47 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine interstitial pores; 45 percent gravel and 5 percent cobbles; slightly acid; clear smooth boundary.
C—47 to 60 inches; pale brown (10YR 6/3) gravelly loamy sand, brown (10YR 4/3) moist; single grain; loose, soft, nonsticky and nonplastic; few very fine and fine roots; many very fine interstitial pores; 25 percent gravel; slightly acid.

Typical Pedon Location

Map unit in which located: Scoap-Wapal complex, 30 to 60 percent slopes
Location in survey area: Spokane County, Washington, about 4 miles west of Nine Mile Falls, Washington; about 1,100 feet north and 2,200 feet west of the southeast corner of section 34, T. 27 N., R. 41 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—20 to 30 inches
Thickness of volcanic ash influence—7 to 16 inches
Rock fragment content in particle-size control section—averages 35 to 50 percent
Clay content in particle-size control section—8 to 12 percent
Reaction—slightly acid, neutral

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—8 to 12 percent
Gravel content—15 to 40 percent
Cobble content—0 to 5 percent

Bw horizon
Value—4 to 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—8 to 12 percent

Gravel content—25 to 50 percent
Cobble content—0 to 30 percent

C horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, loamy sand
Clay content—3 to 10 percent
Gravel content—10 to 40 percent
Cobble content—0 to 25 percent
Stone content—0 to 5 percent

Scrabblers Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash plains
Parent material: Thin mantle of volcanic ash mixed with loess over outwash
Slope range: 0 to 15 percent
Elevation: 1,900 to 2,400 feet
Average annual precipitation: 20 to 25 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Sandy, isotic, frigid Andic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles and twigs.
A1—1 to 5 inches; dark grayish brown (10YR 4/2) ashy fine sandy loam, very dark brown (10YR 2/2) moist; weak fine and medium subangular blocky structure; very friable, soft, nonsticky and nonplastic; weakly smeary; many fine and medium and common coarse roots; many fine irregular pores; 2 percent rounded gravel; slightly acid; clear smooth boundary.
A2—5 to 8 inches; brown (10YR 5/3) ashy fine sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; very friable, soft, nonsticky and nonplastic; weakly smeary; many fine and medium roots; many fine irregular pores; 2 percent rounded gravel; slightly acid; clear smooth boundary.
Bw1—8 to 12 inches; pale brown (10YR 6/3) ashy fine sandy loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; very friable, soft, nonsticky and nonplastic; weakly smeary; common fine and medium roots; many fine irregular pores; 2 percent rounded gravel; slightly acid; clear wavy boundary.
2Bw2—12 to 23 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; very friable, soft, nonsticky and nonplastic; common fine and few medium roots; common medium interstitial pores; 15 percent rounded gravel; slightly acid; clear wavy boundary.
2C1—23 to 36 inches; light yellowish brown (2.5Y 6/4) loamy coarse sand, olive brown (2.5Y 4/3) moist; massive; very friable, soft, nonsticky and nonplastic; few medium roots; many coarse interstitial pores; 10 percent rounded gravel; neutral; gradual wavy boundary.
2C2—36 to 60 inches; variegated gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few medium roots; many coarse interstitial pores; 20 percent rounded gravel; neutral; 1 percent mica flakes.

Typical Pedon Location

Map unit in which located: Scrabblers ashy fine sandy loam, 3 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 3 miles east of Deer Park, Washington; about 1,560 feet north and 1,235 feet east of the southwest corner of section 33, T. 29 N., R. 43 E.

Range in Characteristics

Profile
Depth to loamy sand or sand—20 to 30 inches
Thickness of volcanic ash mantle—7 to 13 inches
Reaction—slightly acid or neutral throughout

A horizon
Value—4 to 6 dry, 2 to 4 moist
Chroma—2 to 4 dry or moist
Texture—ashy fine sandy loam, ashy sandy loam
Clay content—2 to 10 percent
Gravel content—0 to 5 percent

Bw horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy fine sandy loam, ashy sandy loam
Clay content—2 to 8 percent
Gravel content—0 to 10 percent

2Bw2 horizon
Chroma—3 or 4 moist or dry
Texture—sandy loam
Clay content—0 to 5 percent
Gravel content—5 to 15 percent

2C horizon
Hue—2.5Y, 10YR, variegated
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 to 6 dry or moist
Texture—coarse sand, loamy coarse sand
Clay content—0 to 5 percent
Gravel content—10 to 30 percent

Seaboldt Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Treads on outwash plains of basalt plateaus
Parent material: Loess mixed with a minor amount of volcanic ash over glaciofluvial deposits over residuum derived from basalt
Slope range: 0 to 15 percent
Elevation: 1,900 to 2,550 feet
Average annual precipitation: 16 to 25 inches
Average annual air temperature: 42 to 52 degrees F
Frost-free period: 90 to 150 days

Taxonomic class: Coarse-loamy, isotic, mesic Vitrandic Haploxerolls (fig. 33)

Figure 33.—Typical profile of a Seaboldt soil. Numerals on tape indicate centimeters.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 7 inches; brown (10YR 5/3) ashy loam, very dark grayish brown (10YR 3/2) moist; moderate thick platy structure parting to moderate medium subangular blocky; very friable, slightly hard, slightly sticky and slightly plastic; common very fine and few fine to coarse roots throughout; common very fine irregular pores and common very fine and fine tubular pores; 1 percent subrounded fine basalt gravel; slightly acid; clear smooth boundary.

Ap2—7 to 10 inches; brown (10YR 4/3) ashy loam, very dark grayish brown (10YR 3/2) moist; moderate very coarse subangular blocky structure parting to moderate coarse subangular blocky; friable, moderately hard, slightly sticky and slightly plastic; common very fine roots throughout; common very fine and fine tubular pores and common very fine irregular pores; 1 percent subrounded basalt gravel; slightly acid; abrupt smooth boundary.

Bw1—10 to 16 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 3/4) moist; moderate coarse subangular blocky structure; very friable, slightly hard,

slightly sticky and slightly plastic; few fine to medium and common very fine roots throughout; common very fine to medium tubular pores and common very fine irregular pores; 1 percent subrounded basalt gravel; slightly acid; clear smooth boundary.

2Bw2—16 to 23 inches; yellowish brown (10YR 5/4) sandy loam, dark yellowish brown (10YR 3/4) moist; weak coarse subangular blocky structure; very friable, slightly hard, slightly sticky and slightly plastic; common very fine and few fine to coarse roots throughout; few fine tubular pores and common very fine and fine irregular pores; 8 percent subangular basalt gravel and 3 percent angular basalt cobbles; slightly acid; abrupt wavy boundary.

2C—23 to 28 inches; yellowish brown (10YR 5/4) extremely gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; single grain; loose, soft, nonsticky and nonplastic; few fine and medium and common very fine roots throughout; common very fine and fine irregular pores; 70 percent subangular basalt gravel; slightly acid; abrupt wavy boundary.

3R—28 inches; indurated basalt; fractures 4 to 18 inches apart.

Typical Pedon Location

Map unit in which located: Seaboldt ashy loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 3 miles east-northeast of Marshall, Washington; about 300 feet west and 1,250 feet north of the southeast corner of section 13, T. 24 N., R. 42 E.

Range in Characteristics

Profile

Depth to basalt—20 to 40 inches (lithic)
Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—7 to 14 inches
Reaction—slightly acid, neutral

An Oi horizon is in uncultivated areas.

Ap horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy loam, ashy silt loam
Clay content—8 to 22 percent
Gravel content—0 to 10 percent

Bw and 2Bw horizons

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam, sandy loam
Clay content—4 to 18 percent
Gravel content—0 to 25 percent
Cobble content—0 to 10 percent
Total rock fragment content—0 to 30 percent

2C horizon (where present)

Value—5 or 6 dry, 3 or 4 moist
Chroma—4 or 6 dry or moist
Texture—loamy sand, sand, sandy loam
Clay content—2 to 10 percent
Gravel content—10 to 70 percent
Cobble content—0 to 15 percent
Stone content—0 to 5 percent

Total rock fragment content—15 to 75 percent
Lamellae—present in some pedons

Sinkler Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes of hills and mountains
Parent material: Loess over older loess with an influence of volcanic ash in the upper part
Slope range: 10 to 40 percent
Elevation: 2,620 to 3,350 feet
Average annual precipitation: 25 to 33 inches
Average annual air temperature: 42 to 46 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Fine-silty, mixed, superactive, frigid Vitrandic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 0.5 inch; slightly decomposed needles, twigs, leaves, bark, and cones.
Oe—0.5 to 1 inch; moderately decomposed organic matter mixed with 1980's Mount St. Helens volcanic ash.
A—1 to 6 inches; dark brown (10YR 3/3) ashy silt loam, grayish brown (10YR 5/2) dry; moderate fine and medium subangular blocky structure parting to moderate medium and coarse granular; soft, very friable, nonsticky and nonplastic; many very fine and fine and common medium roots; many very fine and common fine tubular pores; 3 percent fine gravel; moderately acid; abrupt wavy boundary.
Bw—6 to 12 inches; brown (10YR 4/3) ashy silt loam, pale brown (10YR 6/3) dry; moderate fine and medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine, fine, and medium and few coarse roots; many very fine and few fine tubular pores; very few faint clay films on faces of peds and in pores and few faint light gray (10YR 7/2) silt coatings in root channels; 5 percent fine gravel; moderately acid; clear wavy boundary.
EBt—12 to 20 inches; dark yellowish brown (10YR 4/4) silt loam, pale brown (10YR 6/3) dry; strong fine and medium subangular blocky structure; hard, firm, slightly sticky and nonplastic; common very fine, fine, and medium and few coarse roots; many very fine and fine tubular pores; few distinct clay films on faces of peds and in pores and few faint light gray (10YR 7/2) silt coatings in root channels; 3 percent fine gravel; moderately acid; clear wavy boundary.
BtE—20 to 28 inches; brown (7.5YR 4/4) silt loam, light yellowish brown (10YR 6/4) dry; strong medium and coarse subangular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine and fine, few medium, and common coarse roots; many very fine and fine and few medium tubular pores; few distinct strong brown (7.5YR 5/6) clay films on faces of peds and in pores and few faint light gray (10YR 7/2) silt coatings on faces of peds and in root channels; 3 percent gravel; moderately acid; clear wavy boundary.
Bt—28 to 38 inches; brown (7.5YR 4/4) silt loam, light yellowish brown (10YR 6/4) dry; strong fine and medium angular blocky structure; very hard, extremely firm, slightly sticky and slightly plastic; common very fine and fine and few medium and coarse roots; many very fine and fine tubular pores; common prominent strong brown (7.5YR 5/6) clay films on faces of peds and in pores and few distinct light

gray (10YR 7/2) silt coatings on vertical faces of peds and in root channels; very few prominent organoargillans along root channels; 10 percent gravel; moderately acid; clear wavy boundary.

Btb—38 to 51 inches; dark brown (7.5YR 3/4) silt loam, brown (7.5YR 5/4) dry; strong fine and medium angular blocky structure; extremely hard, slightly rigid, moderately sticky and moderately plastic; common very fine and fine and few medium and coarse roots between peds; many very fine and few fine tubular pores; common prominent strong brown (7.5YR 5/6) clay films on faces of peds and in pores and root channels and few distinct light gray (10YR 7/2) silt coatings on vertical faces of peds and in root channels; very few prominent organoargillans along root channels; 5 percent gravel, slightly acid; gradual wavy boundary.

Btxb—51 to 60 inches; brown (7.5YR 4/4) silty clay loam, light brown (7.5YR 6/4) dry; moderate medium and coarse angular blocky structure; extremely hard, slightly rigid, moderately sticky and moderately plastic; few very fine, fine, and medium roots between peds; many very fine tubular pores; common prominent strong brown (7.5YR 5/6) clay films on faces of peds and in pores and root channels and few distinct light gray (10YR 7/2) silt coatings on vertical faces of peds and in root channels; very few prominent organoargillans along root channels; approximately 40 percent fragic material; 10 percent gravel; moderately acid.

Typical Pedon Location

Map unit in which located: Sinkler-Arson complex, 10 to 40 percent slopes

Location in survey area: Benewah County, Idaho, about 2.5 miles northwest of the town of Plummer, Idaho; about 420 feet south and 1,690 feet west of the northeast corner of section 10, T. 46 N., R. 5 W.

Range in Characteristics

Profile

Thickness of volcanic ash influence—7 to 12 inches

A horizon

Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam
Clay content—9 to 15 percent
Total rock fragment content—0 to 5 percent gravel
Reaction—moderately acid, slightly acid

Bw horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy silt loam
Clay content—11 to 17 percent
Total rock fragment content—0 to 5 percent gravel
Reaction—moderately acid, slightly acid

EBt and BtE horizons

Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—silt loam
Clay content—15 to 25 percent
Total rock fragment content—0 to 5 percent gravel
Reaction—moderately acid, slightly acid

Bt horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—4 to 6 dry or moist
Texture—silt loam
Clay content—20 to 26 percent
Total rock fragment content—0 to 10 percent gravel
Reaction—moderately acid, slightly acid

Btb horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry, 4 or 6 moist
Texture—silt loam, silty clay loam
Clay content—20 to 33 percent
Total rock fragment content—0 to 10 percent gravel
Reaction—moderately acid, slightly acid

Btxb horizon, or BtxbE horizon (where present)
Hue—10YR, 7.5YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry, 4 or 6 moist
Texture—silty clay loam, silt loam
Clay content—23 to 37 percent
Fragic material content—10 to 40 percent
Total rock fragment content—0 to 10 percent gravel
Reaction—moderately acid, slightly acid

Skalan Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes, shoulders, and ridges of mountains and hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from gneiss, schist, and granite
Slope range: 8 to 40 percent
Elevation: 2,200 to 3,100 feet
Average annual precipitation: 17 to 23 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, isotic, mesic Vitrandic Haploxeralfs

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, twigs, leaves, and cones.
A—1 to 9 inches; dark grayish brown (10YR 4/2) gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; moderate medium granular structure; soft, friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine irregular pores; 15 percent gravel; slightly acid; abrupt wavy boundary.
BA—9 to 16 inches; brown (10YR 5/3) gravelly ashy loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; many very fine and fine and common medium roots; many

very fine and fine irregular pores; 30 percent gravel; moderately acid; clear wavy boundary.

Bt1—16 to 23 inches; yellowish brown (10YR 5/4) very gravelly clay loam, dark yellowish brown (10YR 4/4) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine and medium and few coarse roots; common very fine and fine tubular and irregular pores; 15 percent distinct clay films on peds; 35 percent gravel; moderately acid; clear wavy boundary.

Bt2—23 to 31 inches; light yellowish brown (10YR 6/4) very gravelly loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few fine, medium, and coarse roots; common very fine and fine tubular and irregular pores; 20 percent distinct clay films on peds; 50 percent gravel; moderately acid; clear wavy boundary.

Cr—31 to 36 inches; highly weathered granite; clear wavy boundary.

R—36 inches; slightly weathered, fractured granite.

Typical Pedon Location

Map unit in which located: Kramerhill-Uhlig-Skalan complex, 8 to 25 percent slopes

Location in survey area: Spokane County, Washington, about 3.75 miles north of the town of Mica, Washington; about 2,215 feet south and 1,170 feet east of the northwest corner of section 2, T. 24 N., R. 44 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—3 to 8 inches
Thickness of volcanic ash influence—7 to 15 inches
Depth to bedrock—20 to 40 inches (lithic)

A horizon

Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—10 to 16 percent
Gravel content—15 to 30 percent

BA horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—12 to 18 percent
Gravel content—20 to 35 percent
Reaction—moderately acid to neutral

Bt horizon

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 to 4 dry or moist
Texture—loam, clay loam, sandy clay loam
Clay content—20 to 30 percent
Gravel content—35 to 60 percent
Cobble content—0 to 5 percent
Reaction—moderately acid, slightly acid

A C horizon is in some pedons.

Southwick Taxadjunct

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Backslopes, summits, shoulders, and footslopes of loess hills on basalt plateaus
Parent material: Loess with an influence of volcanic ash in the upper part over older loess
Slope range: 3 to 25 percent
Elevation: 2,400 to 3,100 feet
Average annual precipitation: 19 to 28 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Vitrandic Argixerolls (fig. 34)

Taxadjunct Features

The Southwick soils in this survey area are a taxadjunct to the series because the upper part has properties that meet the criteria for the Vitrandic subgroup. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 6 inches; dark grayish brown (10YR 4/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak medium granular structure; friable, slightly hard, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular pores; moderately acid; clear smooth boundary.

Ap2—6 to 14 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium subangular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; slightly acid; clear smooth boundary.

Bw—14 to 22 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; friable, hard, slightly sticky and slightly plastic; few fine and common very fine roots; common very fine and fine tubular pores; slightly acid; clear smooth boundary.

EB—22 to 27 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; friable, hard, slightly sticky and slightly plastic; few very fine and fine roots; common very fine and fine tubular pores; slightly acid; abrupt smooth boundary.

Ec—27 to 32 inches; light gray (10YR 7/2) silt loam, grayish brown (10YR 5/2) moist; weak medium angular blocky structure; friable, slightly hard, slightly sticky and slightly plastic; few very fine roots; many very fine irregular pores; common fine iron-manganese concretions; slightly acid; abrupt smooth boundary.

Btcxb1—32 to 36 inches; yellowish brown (10YR 5/4) silty clay loam, brown (10YR 4/3) moist; strong medium and coarse prismatic structure; slightly rigid and brittle (some peds), extremely hard, moderately sticky and moderately plastic; few fine roots between peds; few fine irregular pores and common very fine and fine tubular pores; common faint skeletans, many distinct silt coatings, and many distinct clay films on faces of peds; common fine iron-manganese concretions; neutral; gradual wavy boundary.

Btcb2—36 to 48 inches; brownish yellow (10YR 6/6) silty clay loam, brown (10YR 4/3) moist; moderate medium and coarse prismatic structure; extremely firm, very hard, moderately sticky and moderately plastic; few very fine roots between peds; common very fine and fine tubular pores; common faint silt coatings and many

Figure 34.—Typical profile of a Southwick soil. Numerals on tape indicate inches.

distinct clay films on faces of peds; common fine iron-manganese concretions and common manganese coatings on faces of peds; slightly acid; gradual wavy boundary.

Btb3—48 to 60 inches; yellowish brown (10YR 5/4) silt loam, dark brown (10YR 3/3) crushed and moist; moderate medium and coarse subangular blocky structure; very firm, very hard, slightly sticky and moderately plastic; few very fine roots between peds; common very fine and fine tubular pores; few faint silt coatings and many distinct clay films on faces of peds; neutral.

Typical Pedon Location

Map unit in which located: Larkin-Southwick complex, 8 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 0.5 mile west of Mica, Washington; about 2,610 feet north and 1,720 feet west of the southeast corner of section 22, T. 24 N., R. 44 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—16 to 22 inches
Thickness of volcanic ash influence—10 to 14 inches
Depth to argillic horizon—27 to 40 inches
Depth to perched water table—24 to 32 inches in January through April
Depth to redoximorphic features—24 to 32 inches

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 or 2 dry or moist
Clay content—12 to 25 percent
Reaction—moderately acid, slightly acid

Bw horizon
Value—4 or 5 dry, 3 moist
Chroma—2 or 3 dry or moist
Clay content—15 to 25 percent
Reaction—moderately acid to neutral

EB horizon
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 dry or moist
Clay content—15 to 18 percent
Reaction—moderately acid to neutral

Ec horizon, or E horizon (where present)
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 or 3 dry or moist
Clay content—8 to 16 percent
Iron-manganese concretions—none to common, fine
Reaction—slightly acid, neutral

Btb horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—4 or 6 dry, 3 or 4 moist
Texture—silt loam, silty clay loam
Clay content—24 to 35 percent
Iron-manganese concretions—none to common, fine
Reaction—slightly acid, neutral

Btxb horizon (where present)
Value—5 or 6 dry, 3 or 4 moist
Chroma—4 or 6 dry, 3 or 4 moist
Texture—silt loam, silty clay loam
Clay content—24 to 35 percent
Iron-manganese concretions—none to common, fine
Reaction—slightly acid, neutral

Speigle Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes of canyons, escarpments, earthflows, and basalt plateaus
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium derived from basalt
Slope range: 8 to 80 percent
Elevation: 1,650 to 2,700 feet
Average annual precipitation: 16 to 25 inches
Average annual air temperature: 42 to 52 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Loamy-skeletal, isotic, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 6 inches; brown (10YR 4/3) cobbly ashy loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; slightly hard, friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine tubular pores; 15 percent gravel and 15 percent cobbles; neutral; clear wavy boundary.

AB—6 to 17 inches; brown (10YR 5/3) very gravelly ashy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 35 percent gravel and 5 percent cobbles; neutral; gradual wavy boundary.

Bt1—17 to 23 inches; light yellowish brown (10YR 6/4) very cobbly loam, dark yellowish brown (10YR 4/4) crushed and moist; weak fine and medium subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; 5 percent faint clay films on faces of peds; 25 percent gravel and 25 percent cobbles; neutral; clear wavy boundary.

Bt2—23 to 35 inches; very pale brown (10YR 7/4) extremely gravelly loam, yellowish brown (10YR 5/4) moist; moderate fine subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; common very fine irregular pores and few very fine tubular pores; 5 percent faint clay films on faces of peds; 40 percent gravel and 20 percent cobbles; neutral; gradual wavy boundary.

BC—35 to 44 inches; very pale brown (10YR 7/4) extremely cobbly sandy loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few very fine tubular pores and common very fine irregular pores; 30 percent gravel and 40 percent cobbles; neutral; gradual wavy boundary.

C—44 to 65 inches; very pale brown (10YR 7/3) extremely cobbly sandy loam, brown (10YR 5/3) moist; massive; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; many very fine irregular pores and common medium interstitial pores; 30 percent gravel and 55 percent cobbles; neutral.

Typical Pedon Location

Map unit in which located: Klickson-Speigle complex, 30 to 60 percent slopes

Location in survey area: Spokane County, Washington, about 0.5 mile north of Millwood, Washington; about 2,020 feet east and 2,000 feet south of the northwest corner of section 32, T. 26 N., R. 44 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 20 inches
Thickness of volcanic ash influence—10 to 18 inches
Clay content in particle-size control section—10 to 18 percent
Reaction—slightly acid, neutral

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 dry, 2 or 3 moist
Texture—ashy loam
Clay content—10 to 15 percent
Gravel content—5 to 15 percent
Cobble content—10 to 20 percent
Total rock fragment content—15 to 35 percent

AB horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 dry, 2 or 3 moist
Texture—ashy loam, ashy silt loam
Clay content—10 to 15 percent
Gravel content—10 to 35 percent
Cobble content—5 to 30 percent
Total rock fragment content—15 to 45 percent

Bt or Bw horizon
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, silt loam
Clay content—10 to 18 percent
Gravel content—25 to 45 percent
Cobble content—0 to 25 percent
Total rock fragment content—35 to 60 percent

C horizon
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam
Clay content—10 to 15 percent
Gravel content—20 to 50 percent
Cobble content—20 to 60 percent
Total rock fragment content—40 to 85 percent

Spens Series

Depth class: Very deep
Drainage class: Somewhat excessively drained
Position on landscape: Risers of outwash terraces
Parent material: Sandy and gravelly glaciofluvial deposits
Slope range: 15 to 65 percent

Elevation: 1,540 to 2,400 feet
Average annual precipitation: 15 to 20 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Sandy-skeletal, mixed, mesic Typic Xerorthents

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A—0 to 3 inches; brown (10YR 5/3) very gravelly loamy coarse sand, dark brown (10YR 3/3) moist; weak medium granular structure; soft, friable, nonsticky and nonplastic; many very fine and fine roots; many fine interstitial pores; 35 percent gravel; neutral; clear smooth boundary.
C1—3 to 18 inches; yellowish brown (10YR 5/4) very gravelly loamy coarse sand, dark yellowish brown (10YR 4/3) moist; single grain; loose; nonsticky and nonplastic; common very fine and fine roots; many fine interstitial pores; 35 percent gravel; neutral; clear wavy boundary.
C2—18 to 60 inches; yellowish brown (10YR 5/4) very gravelly coarse sand, dark yellowish brown (10YR 4/4) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; many fine and medium interstitial pores; 40 percent gravel; neutral.

Typical Pedon Location

Map unit in which located: Spens very gravelly loamy coarse sand, 30 to 65 percent slopes
Location in survey area: Spokane County, Washington, about 3 miles east of Nine Mile Falls, Washington; about 2,300 feet west and 1,850 feet south of the northeast corner of section 3, T. 26 N., R. 42 E.

Range in Characteristics

Profile
Thickness of ochric epipedon—3 to 6 inches
Rock fragment content in particle-size control section—35 to 60 percent

A horizon
Value—4 to 6 dry, 2 to 4 moist
Chroma—3 or 4 dry or moist
Clay content—2 to 4 percent
Gravel content—35 to 55 percent
Cobble content—0 to 5 percent
Reaction—slightly acid, neutral

An AC or Bkq horizon is in some pedons.

C horizon
Hue—10YR, variegated
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy coarse sand, coarse sand
Clay content—0 to 4 percent
Gravel content—35 to 55 percent
Cobble content—0 to 10 percent
Reaction—slightly acid, neutral

Spokane Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes and shoulders of ridges, mountains, and hills
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from gneiss, schist, and granite
Slope range: 3 to 55 percent
Elevation: 1,700 to 3,600 feet
Average annual precipitation: 15 to 28 inches
Average annual air temperature: 42 to 50 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Coarse-loamy, isotic, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; very dark brown or grayish brown, loose, partially decomposed organic litter composed of pine needles, leaves, twigs, and cones.
A1—1 to 4 inches; grayish brown (10YR 5/2) ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, friable, slightly sticky and slightly plastic; many roots; many very fine tubular and irregular pores; 5 percent gravel; slightly acid; clear smooth boundary.
A2—4 to 10 inches; brown (10YR 5/3) ashy sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; many roots; many very fine tubular and irregular pores; 10 percent gravel; slightly acid; clear smooth boundary.
Bt—10 to 18 inches; pale brown (10YR 6/3) gravelly coarse sandy loam, dark brown (10YR 4/3) moist; weak moderate subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common roots; many very fine tubular and irregular pores; 20 percent gravel; slightly acid; clear wavy boundary.
BCt—18 to 26 inches; pale brown (10YR 6/3) gravelly coarse sandy loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, friable, nonsticky and nonplastic; common roots; many very fine irregular pores; few irregular horizontal bands of loam that are dark yellowish brown (10YR 4/4) moist and 2 to 5 millimeters thick; 20 percent gravel; slightly acid; gradual irregular boundary.
Cr—26 inches; pale brown (10YR 6/3), light gray (10YR 7/2), and gray (10YR 5/1) weathered granite; crumbles to gravelly loamy coarse sand.

Typical Pedon Location

Map unit in which located: Kramerhill-Spokane complex, 8 to 25 percent slopes
Location in survey area: Spokane County, Washington, about 1.5 miles northeast of the town of Foothills, Washington; about 200 feet west and 1,870 feet north of the southeast corner of section 1, T. 26 N., R. 44 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—7 to 16 inches
Thickness of volcanic ash influence—7 to 12 inches
Depth to bedrock—20 to 40 inches (paralithic)
Depth to bedrock—40 to 60 inches (lithic)
Reaction—slightly acid, neutral

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy loam, ashy sandy loam
Clay content—5 to 11 percent
Gravel content—0 to 10 percent

Bt or Bw horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam, coarse sandy loam
Clay content—5 to 10 percent
Gravel content—10 to 30 percent
Cobble content—0 to 5 percent
Total rock fragment content—10 to 30 percent

BCt or BC horizon
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 to 4 dry or moist
Texture—sandy loam, coarse sandy loam, loamy coarse sand
Clay content—3 to 9 percent
Gravel content—10 to 30 percent
Cobble content—0 to 5 percent
Total rock fragment content—15 to 35 percent

A C horizon is in some pedons.

Springdale Series

Depth class: Very deep
Drainage class: Somewhat excessively drained
Position on landscape: Treads and risers of outwash terraces
Parent material: Sandy and gravelly glaciofluvial deposits mixed with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 15 percent
Elevation: 1,540 to 2,500 feet
Average annual precipitation: 15 to 23 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Sandy-skeletal, isotic, mesic Vitrandic Haploxerepts (fig. 35)

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; partially decomposed organic litter composed of pine needles, leaves, twigs, and cones.
A—1 to 3 inches; dark grayish brown (10YR 4/2) gravelly ashy coarse sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots; many very fine, fine, and medium irregular pores; 20 percent gravel and 2 percent cobbles; neutral; abrupt smooth boundary.
AB—3 to 7 inches; pale brown (10YR 6/3) gravelly ashy coarse sandy loam, brown (10YR 4/3) moist; weak fine granular structure; soft, friable, nonsticky and

Figure 35.—Typical profile of a Springdale soil. Numerals on tape indicate feet.

nonplastic; common very fine roots; many very fine irregular pores; 25 percent gravel and 2 percent cobbles; slightly acid; clear wavy boundary.

Bw—7 to 13 inches; pale brown (10YR 6/3) gravelly ashy coarse sandy loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common very fine roots; many very fine irregular pores; 25 percent gravel and 5 percent cobbles; moderately acid; clear wavy boundary.

C1—13 to 25 inches; light yellowish brown (10YR 6/4) very gravelly loamy coarse sand, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, friable, nonsticky and nonplastic; common very fine roots; many fine and medium interstitial pores; 30 percent gravel and 10 percent cobbles; slightly acid; clear wavy boundary.

C2—25 to 61 inches; variegated very cobbly coarse sand; single grain; loose; few very fine roots; many fine and medium interstitial pores; 30 percent gravel, 20 percent cobbles, and 5 percent stones; neutral.

Typical Pedon Location

Map unit in which located: Springdale gravelly ashy coarse sandy loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 0.5 mile west of the junction of U.S. Highway 2 and Colbert Road; about 2,000 feet south and 3,500 feet west of the northeast corner of section 22, T. 27 N., R. 43 E.

Range in Characteristics

Profile

Thickness of volcanic ash influence—7 to 14 inches
Rock fragment content in particle-size control section—35 to 60 percent
Depth to sandy-skeletal horizons—10 to 19 inches
Reaction—moderately acid to neutral
Percentage of surface covered with cobbles or stones—0 to 0.1 percent

A horizon

Value—4 to 6 dry, 2 to 4 moist
Chroma—2 or 3 dry or moist
Clay content—2 to 8 percent
Gravel content—15 to 25 percent
Cobble content—0 to 5 percent
Stone content—0 to 5 percent
Total rock fragment content—15 to 30 percent

AB horizon

Texture—ashy coarse sandy loam, ashy loam
Clay content—2 to 8 percent
Gravel content—15 to 25 percent
Cobble content—0 to 5 percent
Stone content—0 to 5 percent
Total rock fragment content—15 to 30 percent

Bw horizon

Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy coarse sandy loam, ashy sandy loam
Clay content—2 to 8 percent
Gravel content—20 to 40 percent
Cobble content—0 to 10 percent
Total rock fragment content—20 to 50 percent

C1 horizon

Hue—10YR, 2.5Y, variegated
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy sand, loamy coarse sand, sand, coarse sand
Clay content—0 to 5 percent
Gravel content—25 to 50 percent
Cobble content—0 to 15 percent
Total rock fragment content—35 to 60 percent

C2 horizon

Hue—10YR, 2.5Y, variegated
Value—6 or 7 dry, 4 or 5 moist

Chroma—3 or 4 dry or moist
Texture—coarse sand
Clay content—0 to 5 percent
Gravel content—25 to 50 percent
Cobble content—5 to 30 percent
Stone content—0 to 10 percent
Total rock fragment content—35 to 70 percent

Staley Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits, shoulders, and backslopes of loess hills
Parent material: Loess
Slope range: 8 to 25 percent
Elevation: 2,400 to 2,640 feet
Average annual precipitation: 18 to 20 inches
Average annual air temperature: 47 to 50 degrees F
Frost-free period: 110 to 150 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Calcic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 7 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; very friable, soft, slightly sticky and nonplastic; many very fine roots throughout; many medium irregular pores and many very fine tubular pores; noneffervescent; slightly acid; clear smooth boundary.

A—7 to 12 inches; brown (10YR 4/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate coarse subangular blocky structure parting to moderate fine granular; friable, slightly hard, slightly sticky and nonplastic; many very fine roots throughout; many very fine and few fine tubular pores and many medium irregular pores; noneffervescent; slightly acid; clear smooth boundary.

Bw—12 to 23 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; moderate fine prismatic structure parting to moderate medium subangular blocky; very friable, soft, slightly sticky and nonplastic; many very fine roots throughout; many very fine and few fine tubular pores and many medium irregular pores; noneffervescent; neutral; clear smooth boundary.

Bk1—23 to 37 inches; light yellowish brown (10YR 6/4) silt loam, brown (10YR 4/3) moist; moderate fine prismatic structure parting to moderate medium subangular blocky; very friable, soft, slightly sticky and nonplastic; many very fine roots throughout; few fine and many very fine tubular pores; few medium carbonate masses on faces of peds; strongly effervescent; slightly alkaline; clear wavy boundary.

Bk2—37 to 60 inches; brown (10YR 5/3) and yellowish brown (10YR 5/4) silt loam, dark yellowish (10YR 3/3) and dark brown (10YR 3/4) moist; moderate fine prismatic structure parting to weak fine subangular blocky; very friable, soft, slightly sticky and nonplastic; many very fine roots throughout; many very fine tubular pores; common prominent very fine and fine carbonate masses and threads on faces of peds, in pores, and in root channels; violently effervescent; slightly alkaline.

Typical Pedon Location

Map unit in which located: Staley-Naff complex, 8 to 25 percent slopes
Location in survey area: Spokane County, Washington, about 8 miles south of Spangle, Washington; about 1,600 feet north and 850 feet west of the southeast corner of section 7, T. 21 N., R. 43 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 12 inches
Depth to secondary carbonates—10 to 24 inches

A horizon
Value—4 or 5 dry
Chroma—2 or 3 dry or moist
Clay content—15 to 20 percent
Reaction—slightly acid, neutral

Bw horizon (where present)
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—18 to 20 percent
Reaction—slightly acid, neutral

Bk horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Clay content—15 to 22 percent
Reaction—neutral to moderately alkaline

Stapaloop Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash terraces and plains
Parent material: Glaciofluvial deposits with an influence of volcanic ash and loess in the upper part
Slope range: 0 to 25 percent
Elevation: 1,900 to 2,400 feet
Average annual precipitation: 20 to 26 inches
Average annual air temperature: 42 to 49 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Coarse-loamy, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 8 inches; brown (10YR 5/3) ashy fine sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many fine roots; many fine irregular pores; slightly acid; abrupt smooth boundary.
Bw1—8 to 14 inches; yellowish brown (10YR 5/4) ashy fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable,

slightly sticky and nonplastic; many fine roots; many fine irregular pores; slightly acid; clear wavy boundary.

Bw2—14 to 22 inches; light yellowish brown (10YR 6/4) ashy fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many fine roots; many fine irregular pores; slightly acid; clear wavy boundary.

E and Bt1—22 to 32 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist (E part); moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common 1/4-inch-thick faint light yellowish brown (10YR 6/4) continuous wavy bands of fine sandy loam (lamellae), dark yellowish brown (10YR 4/4) moist (Bt part); few fine roots; many fine irregular pores; neutral; clear wavy boundary.

E and Bt2—32 to 52 inches; light yellowish brown (2.5Y 6/4) loamy fine sand, olive brown (2.5Y 4/4) moist (E part); weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common 1/8-inch-thick faint light yellowish brown (10YR 6/4) continuous wavy bands of fine sandy loam (lamellae), dark yellowish brown (10YR 4/4) moist (Bt part); few fine roots; many fine interstitial pores; neutral; clear wavy boundary.

E and Bt3—52 to 60 inches; light yellowish brown (2.5Y 6/4) loamy fine sand, olive brown (2.5Y 4/4) moist (E part); weak medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common 1/2-inch-thick faint light yellowish brown (10YR 6/4) continuous wavy bands of fine sandy loam (lamellae), dark yellowish brown (10YR 4/4) moist (Bt part); few fine roots; many fine interstitial pores; neutral.

Typical Pedon Location

Map unit in which located: Stapaloop ashy fine sandy loam, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 1.5 miles southwest of Deer Park, Washington; about 700 feet south and 1,950 feet east of the northwest corner of section 8, T. 28 N., R. 42 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—4 to 9 inches
Thickness of volcanic ash influence—7 to 23 inches
Reaction—slightly acid or neutral throughout

A horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Clay content—4 to 8 percent
Gravel content—0 to 5 percent

Bw horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy fine sandy loam, ashy sandy loam
Clay content—4 to 8 percent
Gravel content—0 to 5 percent

E and Bt horizon

E part:
Hue—10YR, 2.5Y
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—fine sandy loam, loamy sand, loamy fine sand, sandy loam

Clay content—2 to 6 percent
Gravel content—0 to 10 percent

B part:
Value—5 or 6 dry
Combined thickness of lamellae—less than 6 inches

C horizon (where present)
Texture—sand, loamy sand

Stien Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash plains
Parent material: Thick mantle of volcanic ash over gravelly and sandy outwash
Slope range: 0 to 30 percent
Elevation: 1,700 to 2,700 feet
Average annual precipitation: 22 to 30 inches
Average annual air temperature: 43 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Ashy-skeletal over loamy-skeletal, aniso, glassy over isotic, frigid Typic Vitrixerands

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oe—0 to 1 inch; moderately decomposed plant material.
A—1 to 3 inches; grayish brown (10YR 5/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; very friable, soft, slightly sticky and slightly plastic; common very fine to coarse roots throughout; many very fine irregular and tubular pores; 10 percent subrounded gravel; slightly acid; clear smooth boundary.
Bw1—3 to 8 inches; light yellowish brown (10YR 6/4) ashy silt loam, dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure; very friable, soft, slightly sticky and slightly plastic; common very fine to coarse roots throughout; many very fine irregular and tubular pores; 10 percent subrounded gravel and 2 percent subrounded cobbles; slightly acid; clear wavy boundary.
Bw2—8 to 16 inches; light yellowish brown (10YR 6/4) ashy silt loam, dark yellowish brown (10YR 4/4) moist; weak coarse subangular blocky structure; very friable, soft, slightly sticky and slightly plastic; common fine to coarse roots; many very fine irregular and tubular pores; 10 percent subrounded gravel and 4 percent subrounded cobbles; moderately acid; abrupt wavy boundary.
Bw3—16 to 24 inches; brownish yellow (10YR 6/6) very stony ashy silt loam, light yellowish brown (10YR 6/4) moist; weak coarse subangular blocky structure; very friable, soft, slightly sticky and slightly plastic; common fine to coarse roots; many very fine irregular and tubular pores; 5 percent subrounded gravel, 10 percent subrounded cobbles, and 20 percent subrounded stones; strongly acid; clear irregular boundary.
2Bw4—24 to 31 inches; light yellowish brown (10YR 6/4) very cobbly very fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; very friable, soft, slightly sticky and slightly plastic; few very fine and fine roots; many very fine and fine irregular and tubular pores; 20 percent subrounded gravel, 20 percent subrounded cobbles, and 10 percent subrounded stones; moderately acid; abrupt irregular boundary.

2BC—31 to 48 inches; very pale brown (10YR 7/4) very gravelly loamy sand, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; very friable, soft, nonsticky and nonplastic; few very fine roots; many very fine and fine irregular and interstitial pores; 40 percent subrounded gravel, 10 percent subrounded cobbles, and 5 percent subrounded stones; slightly acid; clear irregular boundary.

2C—48 to 60 inches; variegated extremely gravelly coarse sand; massive; loose, nonsticky and nonplastic; many medium interstitial pores; 45 percent subrounded gravel, 15 percent subrounded cobbles, and 5 percent subrounded stones; slightly acid.

Typical Pedon Location

Map unit in which located: Stien ashy silt loam, 0 to 8 percent slopes, very stony

Location in survey area: Spokane County, Washington, about 4 miles east of Deer Park, Washington; about 1,400 feet north and 2,700 feet west of the southeast corner of section 2, T. 28 N., R. 43 E.

Range in Characteristics

Profile

Thickness of volcanic ash mantle—14 to 24 inches
Percentage of surface covered with subrounded stones—0.1 to 3 percent

A horizon

Value—4 to 6 dry, 2 to 4 moist
Chroma—2 or 3 dry or moist
Clay content—3 to 10 percent
Gravel content—0 to 10 percent
Cobble content—0 to 3 percent
Stone content—0 to 3 percent
Total rock fragment content—0 to 15 percent
Reaction—slightly acid

Bw1 and Bw2 horizons

Value—5 or 7 dry, 3 to 5 moist
Chroma—4 to 6 dry or moist
Texture—ashy silt loam, ashy very fine sandy loam
Clay content—3 to 10 percent
Gravel content—5 to 25 percent
Cobble content—0 to 5 percent
Stone content—0 to 3 percent
Total rock fragment content—5 to 30 percent
Reaction—moderately acid, slightly acid

Bw3 horizon

Value—5 to 7 dry, 3 to 6 moist
Chroma—4 to 6 dry or moist
Clay content—3 to 10 percent
Gravel content—5 to 30 percent
Cobble content—0 to 15 percent
Stone content—0 to 25 percent
Total rock fragment content—35 to 55 percent
Reaction—strongly acid to slightly acid

2Bw horizon

Value—5 or 6 dry, 3 or 4 moist
Chroma—4 to 6 dry or moist

Clay content—4 to 10 percent
Texture—sandy loam, loam, very fine sandy loam
Gravel content—10 to 30 percent
Cobble content—10 to 25 percent
Stone content—10 to 30 percent
Total rock fragment content—35 to 55 percent
Reaction—moderately acid, slightly acid

2BC horizon (where present)
Value—5 to 7 dry, 3 or 4 moist
Chroma—4 to 6 dry or moist
Clay content—3 to 5 percent
Gravel content—20 to 45 percent
Cobble content—10 to 35 percent
Stone content—5 to 20 percent
Total rock fragment content—45 to 85 percent
Reaction—moderately acid, slightly acid

2C horizon
Clay content—0 to 3 percent
Gravel content—35 to 50 percent
Cobble content—0 to 20 percent
Stone content—0 to 15 percent
Total rock fragment content—65 to 85 percent
Reaction—moderately acid, slightly acid

Stutler Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash terraces and outwash plains
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 15 percent
Elevation: 1,900 to 2,500 feet
Average annual precipitation: 15 to 20 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, isotic, mesic Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed plant material; 1/16-inch-thick discontinuous band of 1980's Mount St. Helens ash along boundary between Oi and A horizons.
A—1 to 5 inches; brown (10YR 5/3) gravelly ashy silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, nonsticky and slightly plastic; common very fine and medium and few fine and coarse roots; common very fine tubular and irregular pores; 3 percent subangular basalt cobbles and 20 percent subangular and subrounded basalt gravel; slightly acid; clear smooth boundary.
Bw1—5 to 12 inches; pale brown (10YR 6/3) gravelly ashy silt loam, brown (10YR 4/3) moist; moderate medium and coarse subangular blocky structure; slightly hard,

very friable, slightly sticky and slightly plastic; common very fine, coarse, and very coarse, few fine, and many medium roots; common very fine tubular and irregular pores; 25 percent subangular and subrounded basalt gravel and 5 percent subangular basalt cobbles; slightly acid; clear smooth boundary.

Bw2—12 to 22 inches: light yellowish brown (10YR 6/4) very cobbly silt loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky and slightly plastic; common very fine and coarse, few fine and very coarse, and many medium roots; common very fine and few fine irregular pores and common very fine and few medium tubular pores; 30 percent subangular and subrounded basalt gravel, 25 percent subangular basalt cobbles, and 3 percent subangular basalt stones; slightly acid; clear smooth boundary.

Bw3—22 to 32 inches; light yellowish brown (10YR 6/4) extremely cobbly loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine, fine, and coarse and common medium roots; common very fine and fine irregular pores and common very fine and few medium tubular pores; 45 percent subangular and subrounded basalt gravel, 25 percent subangular basalt cobbles, and 4 percent subangular basalt stones; neutral; clear wavy boundary.

Bq1—32 to 42 inches; pale brown (10YR 6/3) extremely gravelly coarse sandy loam, brown (10YR 4/3) moist; single grain; soft, loose, nonsticky and nonplastic; few very fine, fine, and coarse and common medium roots; common very fine and fine irregular pores; 20 percent discontinuous distinct dark brown (7.5YR 3/3) silica coatings on underside of rock fragments; 55 percent subangular and subrounded basalt gravel, 20 percent subangular basalt cobbles, and 2 percent subangular basalt stones; neutral; clear irregular boundary.

Bq2—42 to 61 inches; variegated extremely gravelly loamy coarse sand; single grain; loose, nonsticky and nonplastic; few fine, coarse, and very coarse and common medium roots; common very fine, fine, medium, and coarse interstitial pores; 10 percent patchy distinct brown (10YR 4/3) silica coatings on underside of rock fragments; 74 percent subangular and subrounded basalt gravel, 10 percent subangular basalt cobbles, and 1 percent subangular basalt stones; neutral.

Typical Pedon Location

Map unit in which located: Stutler-Springdale complex, 3 to 15 percent slopes

Location in survey area: Spokane County, Washington, about 5 miles southeast of Marshall, Washington, just west of U.S. Route 195; about 1,800 feet east and 1,950 feet south of the northwest corner of section 8, T. 23 N., R. 43 E.

Range in Characteristics

Profile

Depth to sandy-skeletal horizons—40 to 55 inches

Thickness of volcanic ash influence—7 to 14 inches

Rock fragment content in particle-size control section (weighted average)—35 to 80 percent

A horizon

Hue—7.5YR, 10YR

Value—3 to 6 dry or moist

Chroma—2 to 4 dry or moist

Texture—ashy silt loam

Clay content—8 to 20 percent

Gravel content—15 to 25 percent

Cobble content—0 to 10 percent

Stone content—0 to 10 percent
Boulder content—0 to 5 percent
Total rock fragment content—15 to 30 percent

Bw1 horizon
Hue—7.5YR, 10YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy silt loam, ashy loam
Clay content—7 to 18 percent
Gravel content—10 to 35 percent
Cobble content—0 to 15 percent
Stone content—0 to 10 percent
Boulder content—0 to 5 percent
Total rock fragment content—15 to 50 percent

Bw2 and Bw3 horizons
Hue—7.5YR, 10YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, loam, sandy loam, coarse sandy loam
Clay content—4 to 18 percent
Gravel content—10 to 60 percent
Cobble content—5 to 35 percent
Stone content—0 to 35 percent
Boulder content—0 to 40 percent
Total rock fragment content—35 to 75 percent
Silica accumulation—coatings on underside of rock fragments in some pedons
Reaction—slightly acid, neutral

Bq horizon
Hue—10YR, 7.5YR, variegated
Value—5 to 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loam, sandy loam, or coarse sandy loam in upper part; loamy coarse sand, sand, or coarse sand in lower part
Clay content—4 to 18 percent in upper part, 0 to 7 percent in lower part
Gravel content—10 to 75 percent
Cobble content—0 to 40 percent
Stone content—0 to 40 percent
Boulder content—0 to 40 percent
Total rock fragment content—35 to 85 percent
Reaction—neutral

Swakane Series

Depth class: Shallow
Drainage class: Well drained
Position on landscape: Summits, shoulders, and backslopes of ridges, hills, and mountains
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from gneiss, schist, or granite
Slope range: 3 to 30 percent
Elevation: 1,900 to 3,400 feet
Average annual precipitation: 17 to 23 inches

Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 130 days

Taxonomic class: Loamy-skeletal, mixed, superactive, mesic Lithic Ultic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 1 inch; slightly decomposed needles, grass, and twigs.
A—1 to 3 inches; grayish brown (10YR 5/2) gravelly ashy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular pores; 15 percent gravel and 2 percent cobbles; moderately acid; clear wavy boundary.
AB—3 to 9 inches; brown (10YR 5/3) gravelly ashy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine roots; common very fine and fine irregular pores; 20 percent gravel and 10 percent cobbles; slightly acid; clear wavy boundary.
Bw—9 to 13 inches; pale brown (10YR 6/3) very cobbly ashy sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine and few medium and coarse roots; common very fine and fine pores; 25 percent gravel and 20 percent cobbles; moderately acid; clear wavy boundary.
C1—13 to 17 inches; very pale brown (10YR 7/3) very gravelly sandy loam, brown (10YR 5/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and medium roots; many very fine and fine interstitial pores; 45 percent gravel and 5 percent cobbles; 50 percent fine mica flakes; slightly acid; gradual wavy boundary.
C2—17 to 19 inches; variegated very gravelly loamy sand; massive; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; many very fine and fine interstitial pores; 2 percent cobbles and 50 percent gravel; 50 percent very fine mica flakes; slightly acid; abrupt wavy boundary.
R—19 inches; indurated gneiss.

Typical Pedon Location

Map unit in which located: Spokane-Swakane complex, 15 to 30 percent slopes
Location in survey area: Spokane County, Washington, about 3.5 miles north of Mica, Washington; about 610 feet south and 440 feet east of the northwest corner of section 2, T. 24 N., R. 44 E.

Range in Characteristics

Profile
Depth to bedrock—10 to 20 inches (lithic)
Thickness of mollic epipedon—7 to 12 inches
Thickness of volcanic ash influence—7 to 12 inches
Reaction—moderately acid, slightly acid

A horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—7 to 15 percent
Gravel content—15 to 30 percent
Cobble content—0 to 5 percent
Total rock fragment content—15 to 30 percent

AB horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—7 to 15 percent
Gravel content—15 to 35 percent
Cobble content—0 to 10 percent
Total rock fragment content—15 to 35 percent

Bw horizon
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy loam
Clay content—5 to 10 percent
Gravel content—25 to 50 percent
Cobble content—0 to 25 percent
Total rock fragment content—35 to 60 percent

C horizon
Hue—10YR, variegated
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—sandy loam, loamy sand
Clay content—5 to 10 percent
Gravel content—30 to 50 percent
Cobble content—0 to 20 percent
Total rock fragment content—35 to 60 percent

Taney Series

Depth class: Moderately deep to a fragipan
Drainage class: Moderately well drained
Position on landscape: Summits, shoulders, and backslopes of hills on basalt plateaus
Parent material: Volcanic ash over loess
Slope range: 3 to 20 percent
Elevation: 2,560 to 3,280 feet
Average annual precipitation: 25 to 28 inches
Average annual air temperature: 43 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Fine-silty, mixed, superactive, frigid Vitrandic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 1 inch; slightly decomposed needles, twigs, leaves, bark, and cones.
Oe—1 to 2 inches; moderately decomposed organic matter mixed with 1980's Mount St. Helens volcanic ash.
A—2 to 4 inches; very dark gray (10YR 3/1) ashy silt loam, grayish brown (10YR 5/2) dry; weak fine subangular blocky structure parting to moderate very fine and fine granular; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine, common medium, and few coarse roots; many very fine tubular pores; neutral; clear wavy boundary.
BA—4 to 15 inches; very dark grayish brown (10YR 3/2) ashy silt loam, brown (10YR 5/3) dry; weak and moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine, common

medium, and few coarse roots; many very fine and few medium tubular pores; slightly acid; gradual wavy boundary.

Bw—15 to 22 inches; dark brown (10YR 3/3) silt loam, brown (10YR 5/3) dry; weak fine and medium subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; many very fine, common medium, and few coarse roots; many very fine and few fine and medium tubular pores; few very fine manganese masses; neutral; gradual wavy boundary.

Bt—22 to 29 inches; dark brown (10YR 3/3) silt loam, pale brown (10YR 6/3) dry; weak and moderate medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine and medium and few coarse roots; many very fine and fine and few medium tubular pores; common faint continuous clay films on faces of peds; few very fine manganese masses; slightly acid; abrupt wavy boundary.

EBc—29 to 31 inches; light olive brown (2.5Y 5/3) silt loam, light gray (2.5Y 7/2) dry; weak fine and medium subangular blocky structure; moderately hard, friable, slightly sticky and slightly plastic; common very fine and few medium and coarse roots; many very fine and fine and few medium tubular pores; about 90 percent of horizon is uncoated silt grains (E material) and 10 percent is B material; many very fine and few fine iron-manganese concretions; common fine prominent iron masses that are light yellowish brown and yellowish brown (10YR 6/4 and 5/4) dry; very strongly acid; abrupt wavy boundary.

Btxcb1—31 to 37 inches; mixed brown and dark yellowish brown (10YR 4/3 and 4/4) silty clay loam, mixed yellowish brown and light yellowish brown (10YR 5/4 and 6/4) dry; moderate medium prismatic structure; very hard, extremely firm and brittle, moderately sticky and moderately plastic; common very fine and few fine, medium, and coarse roots between peds; many very fine and fine and few medium tubular pores; many prominent discontinuous clay films that are brown (7.5YR 4/3) dry and on faces of peds; about 15 percent E material that is white (10YR 8/1) dry and on vertical and top faces of peds; common very fine and few fine iron-manganese concretions; about 60 percent fragic material; very strongly acid; gradual wavy boundary.

Btxcb2—37 to 53 inches; yellowish brown (10YR 5/4) silty clay loam, light yellowish brown (10YR 6/4) dry; weak fine and medium prismatic structure; very hard, extremely firm and brittle, moderately sticky and moderately plastic; few very fine, fine, and medium roots between peds; many very fine and fine and few medium tubular pores; many prominent discontinuous clay films that are brown (7.5YR 4/3) dry and on faces of peds and in pores and few continuous silt coatings that are light gray (10YR 7/2) dry and E material on vertical and top faces of peds; about 75 percent fragic material; strongly acid; gradual wavy boundary.

Btxb—53 to 60 inches; yellowish brown (10YR 5/4) silty clay loam, very pale brown (10YR 7/4) dry; weak fine and medium prismatic structure; very hard, extremely firm, moderately sticky and moderately plastic; few very fine, fine, and medium roots between peds; many very fine and fine tubular pores; many distinct continuous clay films that are brown (7.5YR 4/3) dry and on faces of peds and few discontinuous silt coatings that are light gray (10YR 7/2) dry and E material on vertical and top faces of peds; few very fine iron-manganese concretions; about 60 percent fragic material; slightly acid.

Typical Pedon Location

Map unit in which located: Taney ashy silt loam, 8 to 20 percent slopes

Location in survey area: Benewah County, Idaho, about 5.5 miles west of the town of Plummer, Idaho; about 1,875 feet north and 250 feet west of the southeast corner of section 18, T. 46 N., R. 5 W.

Range in Characteristics

Profile
Depth to fragipan—23 to 40 inches
Depth to perched water table—16 to 22 inches in February, more than 16 inches in March through April
Depth to redoximorphic features—16 to 30 inches
Thickness of volcanic ash influence—10 to 15 inches

A horizon
Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—1 to 3 moist, 2 or 3 dry
Texture—ashy silt loam
Clay content—15 to 23 percent
Reaction—slightly acid, neutral

BA horizon
Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Texture—ashy silt loam
Clay content—15 to 23 percent
Reaction—slightly acid, neutral

Bw or Bt horizon
Hue—10YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silt loam
Clay content—16 to 23 percent
Reaction—slightly acid, neutral

EBc horizon
Hue—10YR
Value—6 or 7 dry, 4 or 5 moist
Chroma—2 to 4 dry, 3 moist
Texture—silt loam
Clay content—10 to 20 percent
Reaction—very strongly acid to moderately acid

Ec or E horizon (where present)
Hue—10YR, 2.5Y
Value—6 to 8 dry, 4 to 6 moist
Chroma—1 to 4 dry, 3 or 4 moist
Texture—silt loam
Clay content—10 to 18 percent
Reaction—strongly acid to slightly acid

Btxcb horizon, or BtxbE horizon (where present)
Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, silt loam
Clay content—24 to 34 percent
Gravel content—0 to 5 percent

Total rock fragment content—0 to 5 percent
Reaction—very strongly acid or strongly acid

Btxb horizon, or Btb horizon (where present)
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, silt loam
Clay content—23 to 38 percent
Gravel content—0 to 5 percent
Total rock fragment content—0 to 5 percent
Reaction—moderately acid to neutral

Tekoa Series

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Shoulders, summits, and backslopes of hills and mountains
Parent material: Volcanic ash and loess over colluvium and residuum derived from metasedimentary rock
Slope range: 10 to 65 percent
Elevation: 2,600 to 3,700 feet
Average annual precipitation: 20 to 35 inches
Average annual air temperature: 45 to 50 degrees F
Frost-free period: 90 to 140 days

Taxonomic class: Loamy-skeletal, mixed, superactive, mesic Vitrandic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 7 inches; brown (10YR 4/3) gravelly ashy silt loam, very dark brown (10YR 2/2) and very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure parting to moderate medium granular; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular and fine irregular pores; 30 percent quartzite gravel; neutral; as much as 0.5 inch 1980's Mount St. Helens ash mixed in horizon; clear smooth boundary.

A2—7 to 13 inches; brown (10YR 5/3) very cobbly silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure parting to moderate fine granular; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine and fine tubular pores and common medium irregular pores; 20 percent quartzite gravel and 20 percent quartzite cobbles; neutral; clear wavy boundary.

BA—13 to 17 inches; brown (10YR 4/3) very cobbly silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure parting to moderate fine angular blocky; slightly hard, friable, moderately sticky and moderately plastic; common very fine and fine roots; common very fine and fine tubular pores and common medium irregular pores; 20 percent quartzite gravel and 35 percent quartzite cobbles; slightly acid; clear wavy boundary.

Bt1—17 to 27 inches; brown (7.5YR 5/4) very cobbly silty clay loam, brown (7.5YR 4/4) moist; weak medium subangular blocky structure; moderately hard, friable, moderately sticky and moderately plastic; common very fine and fine roots; common very fine and fine tubular pores and common medium irregular pores;

20 percent quartzite gravel, 5 percent quartzite paragravel, and 25 percent quartzite cobbles; slightly acid; gradual wavy boundary.

Bt2—27 to 33 inches; yellowish brown (10YR 5/4) very gravelly silty clay loam, dark brown (10YR 3/3) and dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure; moderately hard, friable, moderately sticky and moderately plastic; common very fine and fine roots; common very fine and fine tubular pores and common medium and coarse irregular pores; 40 percent quartzite gravel, 5 percent quartzite paragravel, and 10 percent quartzite cobbles; slightly acid; clear irregular boundary.

R—33 inches; metasedimentary rock.

Typical Pedon Location

Map unit in which located: Libertybutte-Tekoa complex, 5 to 30 percent slopes

Location in survey area: Benewah County, Idaho, about 4 miles west of the town of Tensed; about 850 feet north and 2,500 feet west of the southeast corner of section 7, T. 44 N., R. 5 W.

Range in Characteristics

Profile

Thickness of mollic epipedon—10 to 18 inches
Thickness of volcanic ash influence—7 to 12 inches
Depth to bedrock—20 to 40 inches (lithic)

A1 and A2 horizons

Hue—10YR
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—10 to 22 percent
Texture—ashy silt loam, silt loam
Gravel content—10 to 30 percent
Cobble content—5 to 20 percent
Total rock fragment content—15 to 40 percent
Reaction—slightly acid, neutral

BA horizon (where present)

Hue—10YR, 7.5YR
Value—4 or 5 dry, 2 to 4 moist
Chroma—2 to 4 dry or moist
Texture—silt loam
Clay content—15 to 25 percent
Gravel content—15 to 35 percent
Cobble content—10 to 35 percent
Total rock fragment content—30 to 55 percent
Reaction—slightly acid, neutral

Bt horizon

Hue—10YR, 7.5YR
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—silty clay loam, clay loam, loam
Clay content—21 to 35 percent
Gravel content—25 to 50 percent
Cobble content—10 to 30 percent

Total rock fragment content—40 to 70 percent
Reaction—slightly acid, neutral

Thatuna Series

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Backslopes, footslopes, and summits of loess hills
Parent material: Recent loess over older loess
Slope range: 3 to 30 percent
Elevation: 2,100 to 2,880 feet
Average annual precipitation: 17 to 22 inches
Average annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 150 days

Taxonomic class: Fine-silty, mixed, superactive, mesic Oxyaquic Argixerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 6 inches; dark grayish brown (10YR 4/2) silt loam, very brown (10YR 2/2) moist; moderate fine and medium subangular blocky structure parting to moderate fine granular; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine interstitial and tubular pores; neutral; gradual smooth boundary.

A2—6 to 12 inches; very dark grayish brown (10YR 3/2) silt loam, black (10YR 2/1) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine interstitial and tubular pores; slightly acid; gradual smooth boundary.

AB—12 to 19 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine and fine interstitial and tubular pores; slightly acid; clear smooth boundary.

Bw—19 to 28 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 3/4) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine interstitial and tubular pores; slightly acid; abrupt smooth boundary.

E—28 to 35 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak coarse angular blocky structure parting to massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine and fine interstitial and tubular pores; slightly acid; clear irregular boundary.

Btb/E—35 to 43 inches; mixed pale brown (10YR 6/3) and light gray (10YR 7/2) silty clay loam, brown (10YR 4/3) and grayish brown (10YR 5/2) moist; strong medium and coarse angular blocky structure; hard, firm, sticky and plastic; few very fine roots; many very fine tubular pores; few fine iron-manganese concretions; common distinct clay films on faces of peds and in pores; many thin grayish brown (10YR 5/2) silt coatings on faces of peds; neutral; gradual wavy boundary.

Btb1—43 to 52 inches; light yellowish brown (10YR 6/4) silty clay loam, brown (10YR 4/3) moist; strong coarse prismatic structure parting to moderate medium angular blocky; very hard, very firm, very sticky and very plastic; few very fine roots; few very fine tubular pores; common fine iron-manganese concretions; common distinct clay films on faces of peds and in pores; neutral; gradual wavy boundary.

Btb2—52 to 60 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; strong coarse prismatic structure; hard, firm, sticky and plastic; few very fine roots; few very fine tubular pores; common distinct clay films on faces of peds and in pores; neutral.

Typical Pedon Location

Map unit in which located: Thatuna-Naff complex, 15 to 30 percent slopes
Location in survey area: Spokane County, Washington, about 5 miles south of Waverly, Washington; about 1,430 feet north and 920 feet west of the southeast corner of section 27, T. 21 N., R. 44 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—18 to 28 inches
Depth to perched water table—24 to 36 inches in February through April
Depth to redoximorphic features—24 to 36 inches
Depth to argillic horizon—30 to 40 inches

A horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry, 1 to 3 moist
Clay content—16 to 24 percent
Reaction—moderately acid to neutral

Bw horizon
Value—3 to 5 dry
Chroma—2 to 4 moist
Clay content—18 to 25 percent
Reaction—slightly acid, neutral

E horizon
Hue—10YR, 7.5YR
Value—6 or 7 dry, 3 to 5 moist
Clay content—10 to 15 percent
Reaction—slightly acid, neutral
Abundance of iron-manganese concretions—few to common

Btb horizon
Hue—10YR, 7.5YR
Value—5 or 6 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—silt loam, silty clay loam
Clay content—24 to 35 percent
Reaction—slightly acid, neutral
Abundance of iron-manganese concretions—none to common

Tilma Series

Depth class: Very deep
Drainage class: Moderately well drained
Position on landscape: Toeslopes of loess hills
Parent material: Recent loess over older loess
Slope range: 3 to 8 percent
Elevation: 2,320 to 2,700 feet
Mean annual precipitation: 18 to 22 inches

Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Fine, mixed, superactive, mesic Xeric Argialbolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 8 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak very fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine and few medium roots; many very fine interstitial pores; few uncoated (bleached) silt grains; moderately acid; abrupt smooth boundary.

A—8 to 14 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many fine and very fine roots; many very fine interstitial pores; slightly acid; clear smooth boundary.

Bw—14 to 20 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium prismatic structure parting to weak medium subangular blocky; hard, friable, sticky and plastic; many fine and very fine roots; many very fine and common fine tubular pores; some organic stains on faces of peds; many uncoated (bleached) silt grains; slightly acid; abrupt smooth boundary.

E—20 to 23 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; many fine and very fine roots; few very fine tubular pores; few fine black concretions; slightly acid; abrupt smooth boundary.

Btb1—23 to 30 inches; brown (7.5YR 5/3) silty clay, light yellowish brown (10YR 6/4) rubbed, brown (7.5YR 4/3) moist; strong medium columnar structure parting to weak medium and coarse subangular blocky; extremely hard, extremely firm, very sticky and very plastic; few fine and very fine roots that penetrate peds; many very fine tubular pores; continuous moderately thick clay films on peds; many small and medium black and brown concretions; moderately acid; abrupt smooth boundary.

Btb2—30 to 34 inches; brown (10YR 5/3) silty clay, light yellowish brown (10YR 6/4) rubbed, brown (7.5YR 5/3) moist; moderate medium prismatic structure; very hard, very firm, very sticky and very plastic; few fine roots; common very fine tubular pores; continuous moderately thick clay films on peds; many black and brown concretions that are more than 1 millimeter in diameter; slightly acid; abrupt smooth boundary.

Btb3—34 to 42 inches; brown (10YR 5/3) silty clay, light yellowish brown (10YR 6/4) rubbed, brown (7.5YR 4/3) moist, brown (7.5YR 5/3) rubbed and moist; strong medium subangular blocky structure; very hard, firm, sticky and plastic; few very fine roots; many very fine tubular pores; continuous moderately thick clay films on peds; slightly acid; abrupt smooth boundary.

Btb4—42 to 60 inches; light yellowish brown (10YR 6/4) silt loam, very pale brown (10YR 7/3) rubbed, yellowish brown (10YR 5/4) moist, brown (7.5YR 5/3) rubbed and moist; weak medium prismatic structure parting to strong medium and fine angular blocky; extremely hard, extremely firm, slightly sticky and slightly plastic; brittle and compact; common very fine tubular pores; continuous moderately thick clay films in pores; many small black concretions and patchy stains on peds; neutral.

Typical Pedon Location

Map unit in which located: Naff-Tilma complex, 3 to 20 percent slopes

Location in survey area: Benewah County, Idaho, about 3 miles southeast of Tekoa, Washington; about 560 feet south and 560 feet west of the northeast corner of section 25, T. 45 N., R. 6 W.

Range in Characteristics

Thickness of mollic epipedon—15 to 30 inches
Depth to albic horizon—15 to 30 inches
Depth to argillic horizon—20 to 30 inches
Depth to perched water table—18 to 25 inches in February and March
Depth to redoximorphic features—18 to 25 inches

A horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—1 to 3 dry or moist
Clay content—15 to 20 percent
Reaction—moderately acid to neutral

Bw horizon, or Bt or BE horizon (where present)
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 or 3 dry or moist
Clay content—15 to 18 percent
Reaction—moderately acid to neutral

E horizon
Value—4 or 5 moist
Clay content—13 to 18 percent
Abundance and size of iron-manganese concretions—few to common, about 1 to 4 millimeters in diameter
Reaction—moderately acid to neutral

Btb1, Btb2, and Btb3 horizons
Hue—7.5YR, 10YR
Value—4 to 6 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—clay, silty clay, silty clay loam
Clay content—32 to 45 percent, averages more than 35 percent in particle-size control section
Reaction—moderately acid to neutral

Btb4 horizon
Horizon resembles weak fragipan in some pedons.
Texture—silt loam, silty clay loam
Clay content—18 to 30 percent
Reaction—slightly acid to neutral
Moist consistence—extremely firm to very firm

Torboy Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash terraces and footslopes of hills
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 15 percent
Elevation: 1,800 to 2,900 feet
Average annual precipitation: 20 to 30 inches

Average annual air temperature: 42 to 45 degrees
Frost-free period: 90 to 120 days

Taxonomic class: Sandy, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 0.5 inch; slightly decomposed plant material.
Oe—0.5 to 1 inch; moderately decomposed plant material.
A—1 to 7 inches; brown (10YR 5/3) fine gravelly ashy coarse sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine and fine irregular pores; 15 percent fine gravel; neutral; abrupt smooth boundary.
Bw1—7 to 11 inches; light yellowish brown (10YR 6/4) fine gravelly ashy sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine irregular pores; 15 percent fine gravel; slightly acid; clear wavy boundary.
Bw2—11 to 22 inches; very pale brown (10YR 7/4) fine gravelly ashy sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine and few medium roots; common very fine and fine irregular pores; 15 percent fine gravel; slightly acid; abrupt smooth boundary.
C1—22 to 33 inches; light yellowish brown (2.5Y 6/4) fine gravelly loamy coarse sand, yellowish brown (10YR 5/4) moist; single grain; loose, nonsticky and nonplastic; few very fine, fine, and medium roots; many interstitial pores; 15 percent fine gravel; moderately acid; clear wavy boundary.
C2—33 to 45 inches; variegated gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine, fine, and medium roots; many interstitial pores; 15 percent fine gravel; slightly acid; abrupt wavy boundary.
C3—45 to 60 inches; variegated very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine, fine, and medium roots; many interstitial pores; 55 percent gravel; moderately acid.

Typical Pedon Location

Map unit in which located: Torboy-Blackprince complex, 8 to 15 percent slopes
Location in survey area: Spokane County, Washington, about 3 miles southeast of Camden, Washington; about 2,470 feet west and 2,130 feet north of the southeast corner of section 12, T. 29 N., R. 44 E.

Range in Characteristics

Profile
Thickness of ochric epipedon—3 to 7 inches
Thickness of volcanic ash influence—8 to 22 inches
Depth to sand or loamy sand—20 to 25 inches

A horizon
Value—5 or 6 dry, 2 or 3 moist
Chroma—2 to 4 dry or moist
Texture—ashy coarse sandy loam, ashy sandy loam
Clay content—5 to 10 percent
Gravel content—0 to 20 percent
Reaction—slightly acid, neutral

Bw1 horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy coarse sandy loam
Clay content—5 to 10 percent
Gravel content—0 to 25 percent
Reaction—moderately acid to neutral

Bw2 horizon
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—ashy sandy loam, ashy coarse sandy loam, sandy loam, coarse sandy loam
Clay content—5 to 10 percent
Gravel content—0 to 25 percent
Reaction—moderately acid to neutral

C1 horizon
Hue—10YR, 2.5Y, variegated
Value—6 or 7 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—loamy coarse sand, coarse sand, sand
Clay content—0 to 5 percent
Gravel content—5 to 30 percent
Reaction—moderately acid to neutral

C2 horizon
Hue—10YR, 2.5Y, variegated
Value—6 to 8 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—coarse sand, loamy coarse sand, sand
Clay content—0 to 5 percent
Gravel content—10 to 45 percent
Reaction—strongly acid to slightly acid

C3 horizon
Hue—10YR, 2.5Y, variegated
Value—6 to 8 dry, 4 or 5 moist
Chroma—3 or 4 dry or moist
Texture—coarse sand, loamy coarse sand, sand
Clay content—0 to 5 percent
Gravel content—15 to 55 percent
Reaction—strongly acid to slightly acid

Tucannon Taxadjunct

Depth class: Moderately deep
Drainage class: Well drained
Position on landscape: Backslopes, summits, shoulders, and footslopes of hills on basalt plateaus of channeled scablands
Parent material: Loess mixed with a minor amount of volcanic ash over colluvium and residuum derived from basalt
Slope range: 0 to 35 percent
Elevation: 1,900 to 2,600 feet
Average annual precipitation: 15 to 18 inches

Average annual air temperature: 46 to 50 degrees F
Frost-free period: 110 to 140 days

Taxonomic class: Fine-loamy, mixed, superactive, mesic Vitrandic Haploxerolls

Taxadjunct Features

The Tucannon soils in this survey area are a taxadjunct to the series because they are not Pachic and have properties in the upper part that meet the criteria for the Vitrandic subgroup. These soils have more than 15 percent sand and gravel in the 0.1- to 75-millimeter fraction in the particle-size control section. These differences, however, do not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 5 inches; grayish brown (10YR 5/2) ashy silt loam, very dark brown (10YR 2/2) moist; weak medium granular structure; very friable, soft, slightly sticky and nonplastic; many very fine and few fine to coarse roots throughout; few very fine and fine irregular pores; 3 percent subangular basalt gravel; slightly acid; clear wavy boundary.

AB—5 to 10 inches; grayish brown (10YR 5/2) ashy silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; very friable, slightly hard, nonsticky and nonplastic; many very fine and few fine and medium roots throughout; few very fine and fine irregular pores; 5 percent subangular basalt gravel; slightly acid; gradual wavy boundary.

Bw—10 to 21 inches; brown (10YR 5/3) gravelly ashy silt loam, dark yellowish brown (10YR 3/4) moist; moderate fine subangular blocky structure; very friable, slightly hard, moderately sticky and moderately plastic; many very fine and few fine roots throughout; few very fine and fine tubular pores and few very fine irregular pores; 18 percent subangular basalt gravel; slightly alkaline; gradual wavy boundary.

C—21 to 29 inches; dark yellowish brown (10YR 4/4) gravelly silt loam, dark brown (7.5YR 3/4) moist; massive; very friable, slightly hard, slightly sticky and slightly plastic; many very fine and few fine roots throughout; common fine and few medium irregular pores; 18 percent subangular basalt gravel; neutral; gradual irregular boundary.

R—29 inches; unweathered basalt.

Typical Pedon Location

Map unit in which located: Tucannon ashy silt loam, 0 to 8 percent slopes
Location in survey area: Spokane County, Washington, about 2.6 miles northwest of the town of Deep Creek, Washington; about 2,320 feet west and 159 feet north of the southeast corner of section 16, T. 25 N., R. 40 E.

Range in Characteristics

Profile
Thickness of mollic epipedon—10 to 20 inches
Depth to bedrock—20 to 40 inches (lithic)
Thickness of volcanic ash influence—20 to 35 inches
Clay content in particle-size control section—18 to 25 percent

Ap horizon
Value—4 or 5 dry, 2 or 3 moist
Chroma—2 to 4 dry, 2 or 3 moist
Gravel content—0 to 15 percent

Clay content—10 to 20 percent
Reaction—slightly acid, neutral

AB horizon
Value—3 to 5 dry, 2 or 3 moist
Chroma—2 to 4 dry, 2 or 3 moist
Texture—ashy silt loam, ashy loam
Clay content—15 to 25 percent
Gravel content—0 to 15 percent
Reaction—slightly acid to slightly alkaline

Bw horizon, and Bt and BC horizons (where present)
Hue—10YR, 7.5YR
Value—5 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry, 2 to 4 moist
Texture—ashy silt loam, ashy loam, loam, silt loam
Clay content—18 to 25 percent
Gravel content—5 to 35 percent
Cobble content—0 to 5 percent
Total rock fragments—5 to 35 percent
Reaction—slightly alkaline, moderately alkaline

C horizon
Value—4 to 7 dry, 3 to 5 moist
Chroma—3 or 4 dry, 2 to 4 moist
Texture—silt loam, loam
Clay content—18 to 25 percent
Gravel content—5 to 35 percent
Cobble content—0 to 5 percent
Total rock fragment content—5 to 35 percent
Reaction—neutral, slightly alkaline

A Cr and an R horizon are in some pedons.

Uhlig Series

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Treads and risers of outwash terraces
Parent material: Loess mixed with a minor amount of volcanic ash over glaciofluvial deposits
Slope range: 0 to 25 percent
Elevation: 1,900 to 3,100 feet
Average annual precipitation: 15 to 23 inches
Average annual air temperature: 45 to 52 degrees F
Frost-free period: 100 to 140 days

Taxonomic class: Coarse-loamy, mixed, superactive, mesic Vitrandic Haploxerolls

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap1—0 to 4 inches; dark gray (10YR 4/1) ashy silt loam, black (10YR 2/1) moist; weak fine and medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common fine irregular pores; moderately acid; abrupt smooth boundary.

Ap2—4 to 10 inches; gray (10YR 5/1) ashy silt loam, very dark gray (10YR 3/1) moist; moderate thin and medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common fine irregular pores; slightly acid; abrupt smooth boundary.

A—10 to 18 inches; dark grayish brown (10YR 4/2) ashy loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine irregular pores; neutral; clear wavy boundary.

2Bt1—18 to 32 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; weak coarse prismatic structure parting to moderate medium subangular blocky; hard, firm, slightly sticky and slightly plastic; common fine roots; many very fine irregular pores; few faint patchy clay films on faces of peds and along pores; neutral; clear wavy boundary.

2Bt2—32 to 42 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; weak coarse prismatic structure; slightly hard, friable, slightly sticky and slightly plastic; common fine roots; common fine irregular pores; few faint clay films along pores; many nodules 1/4 to 3/8 inch in diameter that are brown (7.5YR 4/4) moist; neutral; gradual wavy boundary.

2C—42 to 60 inches; very pale brown (10YR 7/3) very fine sandy loam, brown (10YR 5/3) moist; massive; slightly hard, very friable, slightly sticky and nonplastic; few fine roots; many very fine and few fine interstitial pores; neutral.

Typical Pedon Location

Map unit in which located: Brincken, moist-Uhlig complex, 0 to 8 percent slopes

Location in survey area: Spokane County, Washington, about 3 miles north of Millwood, Washington; 1,735 feet south and 1,194 feet east of the northwest corner of section 20, T. 26 N., R. 44 E.

Range in Characteristics

Profile

Thickness of mollic epipedon—18 to 30 inches

Thickness of volcanic ash influence—18 to 50 inches

Clay content in particle-size control section—5 to 18 percent (more than 15 percent particles that are coarser than very fine sand)

A horizon

Value—4 or 5 dry, 2 or 3 moist

Chroma—1 or 2 dry or moist

Texture—ashy silt loam in upper part, ashy silt loam or ashy loam in lower part

Clay content—5 to 18 percent

Gravel content—0 to 5 percent

Reaction—moderately acid to neutral

2Bt horizon, or Bw horizon (where present)

Value—5 to 7 dry, 3 to 5 moist

Chroma—3 or 4 dry or moist

Texture—silt loam or loam in upper part; silt loam, loam, sandy loam, or very fine sandy loam in lower part

Clay content—5 to 18 percent

Gravel content—0 to 5 percent in upper part, 0 to 15 percent in lower part

Reaction—slightly acid, neutral

2C horizon (where present)

Value—5 to 7 dry, 3 to 5 moist

Chroma—3 or 4 dry or moist

Texture—loam, sandy loam, very fine sandy loam

Clay content—5 to 15 percent
Gravel content—0 to 20 percent
Reaction—neutral, slightly alkaline

Some pedons have secondary calcium carbonates below a depth of 44 inches.

Vaywood Taxadjunct

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Summits and backslopes of mountains and ridges
Parent material: Thick mantle of volcanic ash over colluvium and residuum derived from granite and gneiss
Slope range: 15 to 60 percent
Elevation: 4,400 to 5,850 feet
Average annual precipitation: 40 to 50 inches
Average annual air temperature: 38 to 41 degrees F
Frost-free period: 30 to 60 days

Taxonomic class: Medial over loamy-skeletal, amorphic over isotic Typic Vitricryands

Taxadjunct Feature

The Vaywood soils in this survey area are a taxadjunct to the series because they do not meet the criteria for the Haplo great group. This difference, however, does not significantly affect the use, management, and interpretations of the soils.

Typical Pedon

Unless otherwise indicated, colors in the description are for moist soil.

Oi—0 to 2 inches; slightly decomposed needles and twigs.
Oe—2 to 3 inches; moderately decomposed plant material.
A—3 to 8 inches; brown (7.5YR 4/3) medial silt loam, light brown (7.5YR 6/3) dry; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine and common medium roots; many very fine and fine irregular and tubular pores; 5 percent gravel; neutral; clear wavy boundary.
Bw1—8 to 20 inches; brown (7.5YR 4/4) medial silt loam, light brown (7.5YR 6/3) dry; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine, fine, medium, and coarse roots; many very fine and fine irregular and tubular pores; 5 percent gravel; neutral; clear wavy boundary.
Bw2—20 to 24 inches; yellowish brown (10YR 5/4) gravelly medial silt loam, light yellowish brown (10YR 6/4) dry; weak medium subangular blocky structure; soft, very friable, nonsticky and slightly plastic; few medium and coarse and common very fine roots; many very fine and fine tubular and irregular pores; 10 percent gravel and 5 percent cobbles; neutral; abrupt irregular boundary.
2Bw3—24 to 36 inches; yellowish brown (10YR 5/4) very cobbly sandy loam, light yellowish brown (10YR 6/4) dry; weak and moderate fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few fine, medium, and coarse and common very fine roots; common very fine and fine tubular and irregular pores; 20 percent gravel, 30 percent cobbles, and 5 percent stones; strongly acid; clear wavy boundary.
2BCt—36 to 44 inches; yellowish brown (10YR 5/4) extremely stony sandy loam, light yellowish brown (10YR 6/4) dry; weak fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; few very fine, fine, medium, and coarse roots; common very fine and fine tubular and irregular pores; two discontinuous

wavy lamellae about 1 to 2 centimeters thick; 2 percent fine mica flakes; 15 percent gravel, 30 percent cobbles, and 40 percent stones; moderately acid; clear wavy boundary.

2C1—44 to 50 inches; brown (10YR 5/3) extremely stony loamy sand, pale brown (10YR 6/3) dry; massive; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and coarse roots; common very fine and fine irregular pores; 5 percent fine and medium mica flakes; 5 percent gravel, 10 percent cobbles, and 60 percent stones; moderately acid; clear wavy boundary.

2C2—50 to 60 inches; reddish brown (2.5YR 5/3) extremely stony loamy sand, light reddish brown (2.5YR 7/3) dry; massive; slightly hard, friable, nonsticky and nonplastic; many very fine and fine irregular pores; 5 percent fine and medium mica flakes; 10 percent gravel, 10 percent cobbles, and 65 percent stones; moderately acid.

Typical Pedon Location

Map unit in which located: Vaywood medial silt loam, 30 to 60 percent slopes

Location in survey area: Spokane County, Washington, about 1.5 miles northeast of Mount Spokane, Washington; about 1,130 feet north and 750 feet west of the southeast corner of section 10, T. 28 N., R. 45 E.

Range in Characteristics

Profile

Depth to bedrock—more than 60 inches
Thickness of volcanic ash mantle—14 to 24 inches

A horizon

Hue—7.5YR, 10YR
Value—3 or 4 moist, 5 or 6 dry
Chroma—3 or 4 moist or dry
Clay content—3 to 9 percent
Gravel content—0 to 5 percent
Reaction—slightly acid, neutral

Bw horizon

Hue—7.5YR, 10YR
Value—4 or 5 moist, 5 or 6 dry
Chroma—4 to 6 moist, 3 or 4 dry
Clay content—3 to 9 percent
Gravel content—0 to 15 percent
Cobble content—0 to 5 percent
Total rock fragment content—0 to 20 percent
Reaction—slightly acid, neutral

2Bw horizon

Hue—10YR, 2.5YR
Value—4 or 5 moist, 5 to 7 dry
Chroma—3 or 4 moist or dry
Clay content—5 to 10 percent
Gravel content—15 to 30 percent
Cobble content—15 to 35 percent
Stone content—0 to 5 percent
Total rock fragment content—35 to 60 percent
Reaction—strongly acid, moderately acid

A 2Bt horizon is in some pedons.

2BCt or 2BC horizon (where present)
Hue—10YR, 2.5Y
Value—4 or 5 moist, 6 or 7 dry
Chroma—3 or 4 moist or dry
Clay content—5 to 10 percent
Gravel content—15 to 30 percent
Cobble content—20 to 35 percent
Stone content—10 to 40 percent
Total rock fragment content—60 to 85 percent
Reaction—strongly acid, moderately acid

2C horizon
Hue—10YR, 2.5Y
Value—4 or 5 moist, 6 or 7 dry
Chroma—3 or 4 moist or dry
Texture—sandy loam, loamy sand
Clay content—1 to 7 percent
Gravel content—5 to 20 percent
Cobble content—10 to 20 percent
Stone content—35 to 70 percent
Total rock fragment content—65 to 85 percent
Reaction—strongly acid, moderately acid

Wapal Series

Depth class: Very deep
Drainage class: Somewhat excessively drained
Position on landscape: Risers and treads of outwash terraces
Parent material: Sandy and gravelly glaciofluvial deposits with a minor amount of volcanic ash and loess in the upper part
Slope range: 0 to 60 percent
Elevation: 1,540 to 2,500 feet
Average annual precipitation: 18 to 25 inches
Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Sandy-skeletal, isotic, frigid Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Oi—0 to 2 inches; slightly decomposed plant material consisting of needles, cones, twigs, and moss.
A—2 to 6 inches; brown (10YR 5/3) gravelly ashy coarse sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure and moderate medium subangular blocky; slightly hard, very friable, nonsticky and nonplastic; few fine and common medium and very fine roots; common very fine interstitial pores; 20 percent gravel; neutral; clear smooth boundary.
Bw1—6 to 13 inches; yellowish brown (10YR 5/4) gravelly ashy coarse sandy loam, dark grayish brown (10YR 4/2) moist; moderate medium subangular blocky structure parting to moderate fine subangular blocky; slightly hard, very friable, nonsticky and nonplastic; common fine, medium, coarse, and very coarse and few very fine roots; common very fine tubular and interstitial pores; 30 percent gravel; slightly acid; abrupt smooth boundary.

Bw2—13 to 17 inches; yellowish brown (10YR 5/4) very gravelly coarse sandy loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure parting to moderate fine subangular blocky; slightly hard, very friable, nonsticky and nonplastic; common fine, medium, coarse, and very coarse and few very fine roots; common very fine tubular and interstitial pores; 40 percent gravel; slightly acid; abrupt smooth boundary.

BC—17 to 21 inches; yellowish brown (10YR 5/4) very gravelly loamy coarse sand, brown (10YR 4/3) moist; weak medium subangular blocky structure parting to weak fine subangular blocky; soft, very friable, nonsticky and nonplastic; few fine and very fine and common medium and coarse roots; common very fine and fine interstitial pores; 55 percent gravel; slightly acid; abrupt wavy boundary.

C—21 to 30 inches; 20 percent very pale brown (10YR 8/2) and 80 percent light brownish gray (10YR 6/2) extremely gravelly coarse sand, 20 percent very pale brown (10YR 7/3) and 80 percent very dark gray (10YR 3/1) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine and common medium and coarse roots; few fine and common very fine interstitial pores; 15 percent cobbles and 45 percent gravel; slightly acid; clear smooth boundary.

Bq1—30 to 36 inches; 20 percent very pale brown (10YR 8/2) and 80 percent light brownish gray (10YR 6/2) very gravelly coarse sand, 20 percent very pale brown (10YR 7/3) and 80 percent very dark gray (10YR 3/1) moist; single grain; loose, nonsticky and nonplastic; few very fine, fine, and coarse and common medium roots; few fine and common very fine interstitial pores; 5 percent discontinuous distinct pale brown (10YR 6/3) and 25 percent discontinuous distinct white (10YR 8/1) silica coatings on underside of rock fragments; 2 percent cobbles and 55 percent gravel; neutral; clear smooth boundary.

Bq2—36 to 62 inches; 20 percent very pale brown (10YR 8/2) and 80 percent light brownish gray (10YR 6/2) extremely gravelly coarse sand, 20 percent very pale brown (10YR 7/3) and 80 percent very dark gray (10YR 3/1) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; common very fine, fine, and medium interstitial pores; 10 percent discontinuous distinct pale brown (10YR 6/3) silica coatings on underside of rock fragments; 5 percent cobbles and 65 percent gravel; slightly acid.

Typical Pedon Location

Map unit in which located: Scoap-Wapal complex, 30 to 60 percent slopes

Location in survey area: Spokane County, Washington, about 6 miles west of Nine Mile Falls, Washington; about 500 feet north and 400 feet west of the southeast corner of section 20, T. 26 N., R. 41 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—3 to 10 inches

Thickness of volcanic ash influence—7 to 14 inches

Depth to sandy-skeletal horizons—10 to 20 inches from top of mineral soil material

A horizon

Value—4 or 5 dry

Chroma—2 to 4 moist

Clay content—0 to 7 percent

Gravel content—15 to 25 percent

Reaction—slightly acid, neutral

Bw horizon
Value—4 or 5 dry or moist
Chroma—2 or 3 moist, 3 or 4 dry
Texture—ashy coarse sandy loam or ashy sandy loam in upper part, coarse sandy loam or sandy loam in lower part
Clay content—0 to 7 percent
Gravel content—20 to 45 percent
Reaction—slightly acid, neutral

BC horizon (where present)
Value—5 or 6 dry, 3 or 4 moist
Chroma—3 or 4 dry or moist
Texture—loamy coarse sand, loamy sand
Clay content—0 to 4 percent
Gravel content—35 to 70 percent
Total rock fragment content—35 to 70 percent
Reaction—slightly acid, neutral

C horizon
Hue—10YR, variegated
Value—6 to 8 dry, 3 to 6 moist
Chroma—1 to 3 moist
Texture—coarse sand, sand, loamy coarse sand, loamy sand
Clay content—0 to 4 percent
Gravel content—35 to 65 percent
Cobble content—0 to 15 percent
Total rock fragment content—35 to 80 percent
Reaction—moderately acid, slightly acid

Bq horizon (where present)
Hue—10YR, variegated
Value—6 to 8 dry, 3 to 6 moist
Chroma—1 to 3 moist
Texture—coarse sand, sand, loamy coarse sand, loamy sand
Clay content—0 to 4 percent
Gravel content—35 to 70 percent
Cobble content—0 to 10 percent
Total rock fragment content—35 to 80 percent
Reaction—slightly acid, neutral

Wolfeson Series

Depth class: Very deep
Drainage class: Somewhat poorly drained
Position on landscape: Treads of relict glacial lake terraces and glaciofluvial outwash plains
Parent material: Loess mixed with a minor amount of volcanic ash over glaciofluvial and glaciolacustrine deposits
Slope range: 0 to 3 percent
Elevation: 2,000 to 2,300 feet
Average annual precipitation: 22 to 26 inches

Average annual air temperature: 42 to 45 degrees F
Frost-free period: 90 to 120 days

Taxonomic class: Coarse-loamy, isotic, frigid Oxyaquic Vitrandic Haploxerepts

Typical Pedon

Unless otherwise indicated, colors in the description are for dry soil.

Ap—0 to 9 inches; brown (10YR 5/3) ashy very fine sandy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine pores; slightly acid; clear smooth boundary.

Bw1—9 to 21 inches; pale brown (10YR 6/3) ashy fine sandy loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine pores; slightly acid; gradual smooth boundary.

Bw2—21 to 37 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; few fine pores; common light yellowish brown (2.5Y 6/3) iron depletions and common dark yellowish brown (10YR 4/6) masses of oxidized iron; 1 percent gravel; neutral; clear wavy boundary.

C1—37 to 48 inches; pale yellow (2.5Y 7/4) clay loam, light olive brown (2.5Y 5/4) moist; massive; very hard, firm, moderately sticky and moderately plastic; few very fine and fine roots; many very fine pores; many light brownish gray (2.5Y 6/2) iron depletions and few dark yellowish brown (10YR 4/6) masses of oxidized iron; neutral; abrupt smooth boundary.

C2—48 to 53 inches; light yellowish brown (10YR 6/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; massive; very hard, extremely firm, moderately sticky and moderately plastic; no visible roots; many fine pores; many light brownish gray (2.5Y 6/2) and common pale yellow (2.5Y 8/2) iron depletions; few black (10YR 2/1) masses of oxidized manganese and few dark yellowish brown (10YR 4/6) masses of oxidized iron; neutral; clear smooth boundary.

C3—53 to 60 inches; light yellowish brown (2.5Y 6/4) loamy fine sand, olive brown (2.5Y 4/4) moist; single grain; loose, nonsticky and nonplastic; no visible roots; many very fine and few medium interstitial pores; common black (10YR 2/1) masses of oxidized manganese and dark yellowish brown (10YR 4/6) masses of oxidized iron; neutral.

Typical Pedon Location

Map unit in which located: Wolfeson ashy very fine sandy loam, 0 to 3 percent slopes
Location in survey area: Spokane County, Washington, about 1.5 miles southeast of Clayton, Washington; about 483 feet south and 953 feet west of the northeast corner of section 29, T. 29 N., R. 42 E.

Range in Characteristics

Profile

Thickness of ochric epipedon—7 to 9 inches
Thickness of volcanic ash influence—14 to 30 inches
Depth to apparent water table—21 to 37 inches in February through April, more than 21 inches in May through January
Depth to redoximorphic features—20 to 35 inches
Reaction—slightly acid or neutral throughout

Ap horizon
Value—5 or 6 dry, 3 or 4 moist
Chroma—2 or 3 dry or moist
Texture—ashy very fine sandy loam, ashy fine sandy loam
Clay content—5 to 15 percent
Gravel content—0 to 5 percent

Bw1 horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—ashy very fine sandy loam, ashy sandy loam, ashy fine sandy loam, ashy loam
Clay content—5 to 15 percent
Gravel content—0 to 5 percent

Bw2 horizon
Value—5 to 7 dry, 3 to 5 moist
Chroma—2 to 4 dry or moist
Texture—very fine sandy loam, sandy loam, fine sandy loam, loam
Clay content—5 to 15 percent
Redoximorphic features—few to many, fine or medium masses of oxidized iron and few to common iron depletions
Gravel content—0 to 10 percent

C1 horizon
Hue—10YR, 2.5Y
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 to 5 dry or moist
Texture—silt loam, silty clay loam, clay loam
Clay content—10 to 40 percent
Redoximorphic features—few to many masses of oxidized iron and iron depletions
Gravel—0 to 5 percent

C2 and C3 horizons
Hue—10YR, 2.5Y
Value—5 to 7 dry, 4 or 5 moist
Chroma—2 to 5 dry or moist
Texture—fine sandy loam, sandy loam, loam, loamy fine sand, clay loam, silty clay loam
Clay content—5 to 40 percent
Redoximorphic features—few to many masses of oxidized iron and iron depletions
Gravel—0 to 5 percent

Xerolls

Depth class: Very deep
Drainage class: Well drained
Position on landscape: Backslopes of earthflows on hills and basalt plateaus
Parent material: Mass-wasted colluvium derived from mixed sources with an influence of loess and volcanic ash in the upper part
Slope range: 8 to 25 percent
Elevation: 1,660 to 2,400 feet
Average annual precipitation: 18 to 25 inches

Average annual air temperature: 42 to 48 degrees F
Frost-free period: 90 to 130 days

Taxonomic class: Xerolls

Representative Pedon

Unless otherwise indicated, colors in the description are for dry soil.

A1—0 to 4 inches; dark brown (10YR 5/2) silt loam, grayish brown (10YR 3/3) moist; weak medium platy structure parting to moderate very fine angular blocky; friable, slightly hard, slightly sticky and slightly plastic; common very fine and fine roots throughout; many very fine and fine tubular pores; 1 percent fine gravel; slightly acid; clear wavy boundary.

A2—4 to 9 inches; dark brown (10YR 5/3) silt loam, brown (10YR 3/3) moist; moderate medium platy structure; friable, moderately hard, slightly sticky and slightly plastic; common very fine and fine roots throughout; many very fine and fine tubular pores; 1 percent fine gravel; slightly acid; clear wavy boundary.

Bt—9 to 16 inches; dark grayish brown (10YR 6/2) silty clay loam, light brownish gray (10YR 4/2) moist; moderate thick platy structure; firm, moderately hard, moderately sticky and moderately plastic; common very fine and fine and few medium roots throughout; common very fine and fine irregular pores; 1 percent patchy faint clay films along pores; 1 percent gravel and 10 percent cobbles; slightly acid; abrupt wavy boundary.

2C1—16 to 24 inches; light gray (2.5Y 7/2) loamy sand, grayish brown (2.5Y 5/2) moist; massive; very friable, slightly hard, nonsticky and nonplastic; few very fine, fine, and medium roots throughout; many very fine and fine and few medium interstitial pores; 1 percent fine gravel; 1 percent lamellae that are 1/16 to 1/2 inch thick and are 2 to 3 inches apart; slightly acid; clear wavy boundary.

2C2—24 to 60 inches; light gray (2.5Y 7/2) loamy sand, grayish brown (2.5Y 5/2) moist; massive; very friable, slightly hard, nonsticky and nonplastic; few very fine and fine roots throughout; many very fine and fine and few medium interstitial pores; 2 percent medium prominent discontinuous iron masses; 1 percent fine gravel; 10 percent lamellae that are 1/2 to 3/4 inch thick and are 6 to 8 inches apart; slightly acid.

Representative Pedon Location

Map unit in which located: Xerolls silt loam, warm, mass wasted, 8 to 25 percent slopes

Location in survey area: Spokane County, Washington, about 2.5 miles northeast of Mead, Washington; about 570 feet north and 1,225 feet east of the southwest corner of section 30, T. 27 N., R. 44 E.

Range in Characteristics

Lamellae—0 to 10 percent
Total rock fragment content—0 to 85 percent

An R or Cr horizon is below a depth of 40 inches in some pedons.

Formation of the Soils

Within the boundaries of the survey area, 128 soil series and six higher taxonomic units were described and delineated. The appearance and properties of these soils are a result of the interaction of five soil-forming factors—parent material, climate, topography, biological factors, and time. Although each of the factors is discussed separately in this section, they are inseparable with respect to soil formation. For example, a change in the climate influences the ecology that is adapted to a soil type.

Parent Material

Parent material is the unconsolidated organic or mineral material in which a soil forms over time. The soils in the survey area formed in many kinds of parent material. In most areas the material is not homogenous; it commonly consists of a combination of different kinds of material, such as loess and volcanic ash. The soils formed in glaciofluvial and glaciolacustrine deposits, residuum, colluvium, eolian material (loess and volcanic ash), and alluvium.

At different times during the Pleistocene, glaciers from the Cordilleran ice sheet in Canada entered northern Washington and Idaho and advanced south, eventually damming the Columbia and Clark Fork Rivers. Glacial Lakes Columbia and Missoula were eventually created by the ice dams on the rivers, respectively.

The Purcell ice lobe created the dam near Clark Fork, Idaho. It backed up water, creating the enormous Lake Missoula. When the ice dam failed, catastrophic outburst floods deposited glaciofluvial and glaciolacustrine material in much of the survey area. It has been suggested that more than 25 and possibly as many as 89 flood events occurred during the late Pleistocene (Lee, 2009). The torrential forces created by the emptying of the lake scoured the basalt plateau, creating the present-day features of the channeled scablands, large outwash valleys, plains, and terraces. The outwash material consists of thick, unconsolidated, sorted material that was deposited in a high energy/high water velocity environment. It is coarse textured and includes varying amounts of sand, silt, gravel, cobbles, stones, and boulders. The material is derived mainly from granite, gneiss, schist, argillite, quartzite, and local angular to subangular basalt rock fragments in areas southwest of the Spokane River. The Opportunity, Garrison, and Alecanyon series formed in material deposited in this environment. These soils typically have low water- and nutrient-holding capacity in the subsoil and substratum because of the high content of sand and rock fragments. They can be an important source of sand and rock for quarries.

North of the Spokane River, flooding was less extensive and the deposits are associated with lower velocity meltwater. These glaciofluvial deposits consist mainly of silt, sand, and gravel. The Kanisku, Torboy, Stapaloop, Scrabblers, Stien, Bonner, Elokia, and Elmira series formed in outwash material deposited in this environment. Thick glaciolacustrine deposits entrained with calcium carbonates (lime) are on the Peone Prairie as a result of the sediment-rich meltwater that became confined, creating small glacial lakes and areas of slack water. Green Bluff, Cedonia, and Hunters series are representative of soils that formed in this silty sediment. These soils have a high content of silt and some clay and do not have gravel and cobbles.

They have a high capacity to store moisture and nutrients, making them important for agriculture. The surface layer of most of these soils is influenced by varying amounts of loess and volcanic ash.

Loess is wind-deposited, silt-sized material that originated west of the survey area, in the Columbia Basin, from slack water deposits from catastrophic outburst floods of glacial Lake Missoula. Loess is dominant in most of the southeastern part and some of the northwestern part of the area. It occurs as remnant “islands” of the channeled scablands west of Cheney. It is a few inches thick to as much as 75 feet thick (Johnson and others, 1998). The soils that formed in loess have high agricultural value.

Loess also has influenced the upper part of most of the soils throughout the survey area. Most of these soils formed in recent loess deposited during the interglacial and interstadial periods of the late Pleistocene to early Holocene (Busacca and McDonald, 1994). The younger deposits, which are typically at the surface, are less compact and have a distinct dark color because of the higher content of organic matter. The Athena and Naff soils have a thick dark-colored surface layer and an available water capacity and nutrient capacity that is favorable for plants.

The older (palesol) loess typically is beneath the layer of more recent loess. The older loess ranges from more compact to dense, is light brown to reddish brown in color, and has more clay and less organic matter. A perched water table can develop on this layer during the wetter months in spring. The Thatuna, Southwick, and Driscoll soils have a high content of clay in the subsoil, which restricts the downward movement of water. The Santa and Carlinton soils have a dense layer, called a fragipan, that restricts water and roots.

The other major eolian deposit is volcanic ash. The volcanic ash in the survey area, dominantly silt sized, originated west of Spokane from the many active volcanoes in western Washington and western Oregon, including Mount St. Helens, Mount Rainier, and Glacier Peak. The greatest contribution of ash in this area, however, was from the eruption of Mount Mazama about 7,700 years ago, the cone of which is now Crater Lake in southwestern Oregon (USGS, 2002). The Mazama airfall tephra was of sufficient extent and thickness to significantly affect the soils in the area.

Volcanic ash has soil properties and qualities similar to a sponge in that it can store moisture that is available for plant growth. The ash covered the entire area, but its influence depends on the stability of the landscape and the vegetative cover. Many of the soils in the survey area are classified as Andisols or as andic and vitrandic intergrades of other soil orders. Soils on stable landscapes with an abundant coniferous cover have a thick mantle of volcanic ash. These soils are classified as Andisols, and they include the Bouldercreek, Jacot, Boulderjud, and Hysing series. Other ash-influenced soils that have been subject to mixing and reworking have a thin mantle of volcanic ash. These are classified as andic intergrades, and they include the Fan Lake and Scrabblers series. Ash-influenced soils in areas that are subject to a greater amount of erosion and mixing are classified as vitrandic intergrades. A minor amount of ash typically is mixed with the loess in the surface layer. These soils include the Lenz, Spokane, Kramerhill, Glenrose, and Micapeak series.

Soils on the mountains, hills, and plateaus formed in residuum and colluvium derived from igneous extrusive Miocene basalt, igneous intrusive Cretaceous granitic and metamorphic rock, and Precambrian metasedimentary rock (Johnson and others, 1998). This rock is highly fractured, and it is highly weathered in some soils. Most of the soils that formed in this material have a high percentage of rock fragments, ranging from gravel to stones. The soils derived from basalt include the Klickson, Northstar, Rockly, and Speigle series. The Bouldercreek, Boulderjud, Jacot, Hysing, and Lenz series are typical of soils that formed in granitic and high-grade metamorphic rock. The Ardenvoir, Tekoa, and Lotuspoint series are representative of soils derived from metasedimentary rock. The surface layer of all of these soils has varying amounts

of loess and volcanic ash that was deposited during the late Pleistocene and the Holocene (USDA, 2008).

Recent alluvium is the parent material associated with streams and in basins and closed depressions. This material typically consists of sediment from the upland areas that was deposited during periods of overflow. In most areas, the material is derived from a variety of sources and has been transported long distances. The Endoaquolls and Fluvaquents are examples of alluvial soils that are in low-lying areas adjacent to major streams and rivers. These soils can be highly stratified and vary in the content of sand, silt, clay, and rock fragments. They commonly are limited by wetness and flooding, and they support hydrophytic vegetation.

The Caldwell and Cald series formed in local alluvium derived from the surrounding loessal uplands. These soils are in narrow and broad drainageways in areas of loess hills. They typically have a thick, dark-colored surface layer composed of silt- and clay-sized particles. They have a seasonal high water table and a high capacity to store moisture and nutrients for plant growth. In the channeled scablands and in some drainageways, airfall tephra has been eroded from the uplands, reworked by water, and deposited on flood plains and in depressions and drainageways. The soils in these areas are saturated with water and do not have andic properties. The Hoodoo and Cocolalla series formed entirely in volcanic ash. These soils have a high water table, are ponded, and support hydrophytic vegetation.

Some of the soils in the survey area formed in organic material. Examples are the Pywell and Saltese series. These soils formed in highly decomposed organic material derived from hydrophytic plants, and they are on flood plains, in depressions, and adjacent to open water areas and Newman and Liberty Lakes. They commonly are dark in color, are subject to subsidence, and have low strength. Unless drained or protected by water-control structures, these soils have a high water table, may be ponded, and support hydrophytic vegetation. They provide excellent habitat for wildlife.

Climate

Climate is influenced by the Cascade and Rocky Mountain Ranges. The Rocky Mountains shield the area from the more severe winter storms that move southward across Canada, and the Cascade Mountains act as a barrier to the easterly flow of moist air from the Pacific Ocean. The climate generally is continental, but it has maritime characteristics in areas where air from both of these sources reaches Spokane (USDA, 1968). It is subhumid with warm, relatively dry summers and cold, moist winters.

The mean annual precipitation in the survey area is about 15 to 50 inches. The mean annual rainfall near Spokane is about 17 to 20 inches. The amount of precipitation increases from about 15 inches in the southwestern part of the area to about 25 inches near the Idaho border. The highest amount of precipitation, about 50 inches, is received on Mount Spokane.

Precipitation and temperature strongly influence the rate of weathering of rock, the decomposition of minerals, the activity of micro-organisms, the accumulation and decomposition of organic matter, the growth of plants, and the processes of leaching, eluviation, and illuviation. The effects of precipitation on chemical weathering, leaching, eluviation, and illuviation and the subsequent soil horizon development are easily observed in areas of loess.

For example, the Staley and Naff series formed in similar loess but they are in different precipitation zones. As a result, the subsoil of these soils has different characteristics and properties. The Staley soils formed in the 18- to 20-inch precipitation zone. Soil moisture is adequate for the highly soluble calcium in the soil to be transferred downward in the profile and become a precipitate of secondary calcium

carbonate (lime) as the soil warms up and becomes drier. This layer of secondary calcium carbonate accumulation, referred to as a Bk horizon, is at a depth of 10 to 24 inches. In contrast, the Naff soils are in areas where the precipitation is about 22 inches. Calcium is leached from the soil profile, minerals break down into clay-sized particulates, and a clay-enriched argillic horizon, or Bt horizon, is formed.

Climate not only varies on a broad geographic scale, but it also differs within short distances because of slope, aspect, and elevation. Generally, differences in the mean annual precipitation and temperature are associated with changes in elevation. In the survey area, precipitation is highest, more than 45 inches, at the higher elevations and the coldest temperatures, 38 to 44 degrees F, occur in the higher elevation mountains. The Vaywood and Brickel series formed in a cold environment on mountains and ridges at the higher elevations. Summers are cooler and winters are colder in the mountainous areas than in the valleys. In addition, temperatures are cooler on north aspects than on south aspects. The Klickson and Lacy series are geographically associated, but they are on different aspects. The cooler Klickson soils are on north-facing slopes, and the warmer Lacy soils are on south-facing slopes. The mean annual temperature in the Spokane Valley is about 46 to 50 degrees F, which is the warmest in the survey area. The Opportunity soils are on outwash terraces in the Spokane Valley.

Climate also influences the kind and amount of native vegetation on the soils. Soils in the cooler, wetter parts of the survey area dominantly support a dense canopy of conifers. The Bouldercreek, Jacot, Hysing, Nakarna, and Boulderjud series are examples. Soils that formed under trees have a thick layer of litter and a thin dark-colored mineral surface layer. The soils in the warmer, drier parts of the area have a more open tree canopy and more grass in the understory. These soils, such as those of the Glenrose, Opportunity, Speigle, and Southwick series, have a thick, dark-colored surface layer that has a high content of humus and a subsoil from which exchangeable bases have been leached. The thick, dark-colored surface layer is due in part to the annual dieback of grass roots that are incorporated into the upper part of the soils. The soils that support more grass have a higher content of organic matter than do the soils that formed under a dense canopy of coniferous trees.

Topography

Topography, or relief, and the unique landscapes in the survey area are the result of a complex geologic history. The geologic formations are influenced by age and resistance to erosion by wind and water. The hills and mountains are the result of uplift during the Late Cretaceous. The largest geomorphic feature in the area is the eastern edge of the Columbia Plateau. The plateau is comprised of Columbia River Basalt from multiple lava flows originating from vents in eastern Oregon, southeastern Washington, and Idaho during the Miocene (Johnson and others, 1998). The Wanapum and Grande Ronde Basalt and associated members are from the flows in Idaho and are exposed in the survey area. These flows are underlain and interbedded with lacustrine and fluvial sediment, known as the Latah Formation. This formation is the result of a thick accumulation of sediment in local lakes along the eastern margin of the basalt field, where lava flows dammed drainageways and backed up water. The plateau is nearly level to moderately steep, except in areas where it has been incised by rivers and streams to form steep slopes and canyons. It is also the underlying landscape on which thick surficial deposits of loess and outwash formed the terraces, plains, and hills during the Pleistocene to early Holocene. Where outburst floods from glacial Lake Missoula scoured and exposed the basalt plateau, the channeled scablands were formed. The scablands are an extensive area composed of rock outcroppings, cliffs, small channels, drainageways, and closed depressions and large “islands” of loess.

Most of the area is drained by the Spokane River and its two main tributaries, the Little Spokane River and Hangman Creek.

A soil sequence, or catena, is useful in understanding the topographic effects on drainage, runoff, soil formation, and soil horizonation. For example, a typical soil catena of loess hills is composed of landform segments that include north-facing, sloping, linear, and concave backslopes; level and nearly level linear to convex summits and shoulders; and sloping, linear, south-facing backslopes transitioning to level drainageways. The soil series sequence associated with these positions are the Thatuna and Southwick soils on north-facing slopes, the Garfield and Driscoll soils on summits and shoulders, and the Naff and Larkin soils on south-facing slopes. The Thatuna and Southwick soils are moderately well drained, have an E horizon that has been leached of clay, and are subject to episaturation. In contrast, the Naff and Larkin soils on south-facing slopes are well drained, are warmer and drier, and do not have an E horizon. The lower positions of the drainageways are level, have poor drainage, and do not have drainage outlets. The soils have features and horizons that are associated with a fluctuating water table and prolonged saturation. These wetness features are associated with iron transformation and are referred to as redoximorphic concentrations and depletions. They are in the Bgt and Bt horizons in the Caldwell and Cald series.

The soils in depressions have an abundance of hydrophytic plant material and are saturated. Soils such as the Saltese and Pywell series formed in depressions and drainageways, where water accumulates, hydrophytic plant material is abundant, and drainage is very poor, creating anaerobic soil conditions. In this saturated environment, the rate of decomposition of the plant material is slower than the rate of accumulation. As a result, the soils have a very high content of organic matter.

Topographic factors, such as the steepness, shape, and aspect of the slope, affect the distribution of soil moisture and the vegetative cover. An example is the vegetation pattern on the southwestern part of Tekoa Mountain, in the southeast corner of the survey area. The Ardenvoir and McCrosket series on the north-facing slopes are sheltered from solar radiation and prevailing winds, have cooler soil temperatures, and retain more moisture for longer periods. These soils support forest vegetation. In contrast, the Tekoa series on the south-facing slopes are exposed to more direct solar radiation and prevailing winds and thus are warmer and drier. These soils support rangeland vegetation.

Steepness of slope, gravity, and mass movement influence topography and its effect on the processes of soil formation. Mass movement has resulted in deposits in the canyons and on the steeper slopes of the basalt plateaus. In some areas, these landslide deposits are associated with and overlie the Latah Formation. The deposits consist of unconsolidated material that can contain individual blocks of basalt as much as 26 feet in diameter. They commonly are covered or buried with sandy outwash deposits. In areas where this has occurred, the soils and map unit names are identified as “mass wasted.” An example is Marble-Speigle complex, mass wasted, 8 to 30 percent slopes. The Marble soil formed in outwash, and the Speigle soil has properties associated with gravity and the mixing of downslope soil material and landslide deposits.

In some areas, the deposits have been active (Johnson and others, 1998). Xerolls have been subject to repeated episodes of erosion, mixing, and downslope soil movement. The soil properties are so highly variable due to mixing and colluvial processes that they cannot be defined at the series level. The Lakespring series is associated with Xerolls, but these soils formed in complex landslide deposits interbedded with dense laminated sediment of the Latah Formation. The dense layers result in lateral growth of roots and movement of water. During the wetter months in spring, these soils have a perched water table.

Biological Factors

Living organisms can affect soil formation in many ways. Plants, animals, insects, and micro-organisms contribute to the amount of organic matter and plant nutrients in the soil and to changes in porosity and structure. Roots, rodents, and insects penetrate the soil and alter its structure. Soil structure and aggregate stability is also influenced by the amount and transformation of organic matter by soil micro-organisms. These organisms produce organic compounds and fungal mycelia that can bind soil particles together, contributing to overall aggregate stability and soil health. In well aerated, healthy soils, other micro-organisms such as actinomycetes (bacteria) breakdown organic compounds and give the soil an “earthy” smell. Pioneering organisms, such as lichens, contribute to the decomposition of bedrock. Plant roots and soil fauna, such as burrowing insects and worms, increase the porosity of soils. Increased porosity improves infiltration and the ability of soils to store water, cycle nutrients, and exchange water and air, resulting in an optimal medium for biological activity.

The biological factors are strongly influenced by the climate. As precipitation and temperature change, the composition of vegetation and its associated ecological community changes accordingly. Generally, the three major ecological communities in the area are grassland consisting of bunchgrasses, mainly bluebunch wheatgrass and Idaho fescue, that transitions with increasing precipitation to a grass/shrub steppe community comprised of bunchgrasses, shrubs, and forbs; open stands of conifers, mainly of ponderosa pine, with an understory of bunchgrasses and shrubs; and dense coniferous stands with an overstory of western hemlock, western red cedar, grand fir, Rocky Mountain Douglas-fir, western white pine, and western larch and an understory of forbs and shrubs and little, if any, grass. Other ecological communities include semiwet and wet meadows.

Ecological communities and their associated biological factors effect soil properties and formation. Color and thickness of the surface layer are significantly influenced by the plant community. Soils that formed under grassland, such as the Athena series, have a thick, dark-colored surface layer because of the biomass from the fibrous root system. The Stutler series formed under an open stand of conifers with an understory of grasses. These soils have a thin, dark-colored surface layer. In contrast, soils such as the Nakarna and Keeler series have a dense forest canopy with an understory of dominantly forbs and shrubs. Because of the concentration of forest litter, these soils have a thin, lighter colored, transitional A horizon immediately below the layer of duff.

Soils that support wet meadow plant communities composed of water-tolerant grasses, sedges, and forbs have a thick, dark-colored surface layer as a result of the concentration of biomass in the root zone. Examples are the Bridgeson and Cocolalla series. During soil formation, drainage was poor, water was readily available, and native plants grew abundantly. This environment is favorable for micro-organisms to decompose the organic matter and incorporate into it into the soil. Soil bacteria also plays a role in the reduction of iron and manganese in these saturated soils. Decomposition and transformation of organic compounds produce hydrogen sulfide in soils that have poor aeration and an abundance of organic material, such as the Pywell and Saltese series, resulting in a “rotten egg” odor.

Time

The end of the last glacial period in the area marked the time for soil formation to begin, about 11,250 years ago (Baker and others, 1991). Since that time, soil formation has continued as a result of four general soil-forming processes—additions, losses, transformations, and translocations (Simonson, 1959). Soil horizonation is the result of these processes acting over time. Soil morphology consists of the kind, arrangement, and distinctness of soil horizons (Buol and others, 2003). The expression and features

of horizons depend in part on the length of time these processes have acted on the soil and on the stability of the landscape.

Soil horizonation can be used to determine the relative age of soils. Soils with minimal horizonation are relatively young because there has not been sufficient time for the parent material to undergo complex chemical and physical transformations. Older soils have a strongly expressed subsoil. Soils that have moderately expressed horizons are considered to be intermediate in age.

Young soils can occur on landforms such as flood plains and drainageways, where fresh sediment and recent alluvium have accumulated over time or are deposited annually. These unconsolidated deposits are subject to fluvial processes that can result in a repeated pattern of deposition and burial. Fluvaquents and Endoaquolls are examples of soils that do not have a well developed B horizon, have stratified layers, and have minimal horizonation that may consist of an A and C horizon. The dark-colored A horizon in the Endoaquolls is a result of additions of organic matter over a relatively short amount of time. The thin A horizon in the Fluvaquents is underlain by a C horizon that consists of multiple minimally developed layers of different textures.

The Freeman, Reardan, Driscoll, Santa, and Southwick series are on the older, more stable positions of the loess hills. These soils are the oldest and have the most well expressed subsoil. Presence of a clay-enriched subsoil suggests that the landscape and soil-forming processes have been stable since the end of the last glacial period. The subsoil has a high degree of chemical weathering and a significant accumulation of clay (argillic horizon, or Bt horizon), which can take thousands of years to form. There has been sufficient time and stability for the translocation of silicate clay to take place, which is indicated by the abrupt change in texture from the surface layer to the Bt horizon. These soils have a light-colored, strongly leached E horizon above the Bt horizon.

Soils on the mountains and foothills vary in the degree of development and horizonation. Younger soils, such as the Cassyhill and Lotuspoint series, are shallow and moderately deep to hard bedrock. Enough organic matter has accumulated to form a dark-colored surface layer. Minimal chemical alteration of primary minerals has taken place, but the soils do not have a well developed subsoil. In contrast, soils such as the Schumacher, Skalan, and Tekoa series are intermediate in age. They have had sufficient time for translocation of silicate clay minerals, indicated by changes in the color, structure, and texture of the Bt horizon.

The Opportunity and Garrison series on the outwash terraces in the Spokane Valley are intermediate to young in age. There has been enough time for the breakdown and incorporation of organic matter to form a dark-colored surface layer. Chemical alterations in the subsoil have resulted in a moderately developed Bw horizon, which indicates that illuvial accumulations of silicate clay minerals has not taken place.

Glossary

Many of the terms relating to landforms, geology, and geomorphology are defined in more detail in the “National Soil Survey Handbook” (available in local offices of the Natural Resources Conservation Service or on the Internet).

Abrupt textural change. A soil horizon boundary or thin transitional zone characterized by a considerable increase in clay that occurs at the contact between a surface layer, subsurface layer, subsoil, or substratum.

Aeration, soil. The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.

Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

Albic horizon. An eluvial horizon that is at least 1 centimeter thick or more. The color of the soil material is largely determined by the color of primary sand and silt particles rather than by the color of their coatings.

Alkali (sodic) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Alluvium. Unconsolidated material, such as gravel, sand, silt, clay, and various mixtures of these, deposited on land by running water.

Alpha,alpha-dipyridyl. A compound that when dissolved in ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction implies reducing conditions and the likely presence of redoximorphic features.

Andic soil properties. A collection of physical and chemical properties that define the criteria for the Andisol order.

Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.

Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.

Ash (volcanic). Unconsolidated, pyroclastic material less than 2 millimeters in all dimensions; commonly called volcanic ash.

Ashy (family particle-size class). A substitute class term used for the family particle-size in mineral soils.

Ashy (textural modifier; for example, ashy sandy loam). A term used to describe material in which the fine-earth fraction has 30 percent or more particles that are 0.02 to 2.0 millimeters in diameter. Of this, 5 percent or more is volcanic glass and the ammonium oxalate extractable aluminum plus ½ the ammonium oxalate extractable iron times 60 added to the percentage of volcanic glass are equal to or more than 30.

Aspect. The direction toward which a slope faces. Also called slope aspect.

Aspect, north. All compass directions with a northerly aspect, including west-northwest, northwest, north-northwest, north, north-northeast, northeast, and east-northeast. North aspects have less solar radiation than south aspects and consequently are cooler and more moist.

Aspect, south. All compass directions with a southerly aspect, including east-southeast, southeast, south-southeast, south, south-southwest, southwest, and west-southwest. South aspects have more solar radiation than north aspects and consequently are warmer and more droughty.

Association, soil. A group of soils or miscellaneous areas geographically associated in a characteristic repeating pattern and defined and delineated as a single map unit.

Available water capacity (available moisture capacity). The capacity of soils to hold water available for use by most plants. It is commonly defined as the difference between the amount of soil water at field moisture capacity and the amount at wilting point. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low	0 to 3
Low	3 to 6
Moderate	6 to 9
High	9 to 12
Very high	more than 12

Backslope. The position that forms the steepest and generally linear, middle portion of a hillslope. In profile, backslopes are commonly bounded by a convex shoulder above and a concave footslope below.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Basalt. A fine-grained, dark-colored extrusive igneous rock composed primarily of calcic plagioclase and pyroxene, with or without olivine.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, and K), expressed as a percentage of the total cation-exchange capacity.

Base slope (geomorphology). A geomorphic component of hills consisting of the concave to linear (perpendicular to the contour) slope that, regardless of the lateral shape, forms an apron or wedge at the bottom of a hillside dominated by colluvium and slope-wash sediments (for example, slope alluvium).

Basin. A low area in the earth's crust, of tectonic origin, in which sediment has accumulated.

Bedding system. A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.

Bedrock. The solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.

Bedrock-controlled topography. A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.

Bottom land. An informal term loosely applied to various portions of a flood plain.

Boulders. Rock fragments larger than 2 feet (60 centimeters) in diameter.

Breaks. A landscape or tract of steep, rough or broken land dissected by ravines and gullies and marking a sudden change in topography.

Breast height. An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.

Brush management. Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.

Bulk density. The mass of soil per unit bulk volume. Moist bulk density refers to the oven-dry weight of a given volume of soil with moisture content at or near field moisture capacity.

Calcareous soil. A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.

Calcic horizon. An illuvial horizon in which secondary calcium carbonate or other carbonates have accumulated to a significant extent (Soil Survey Staff, 1999).

Calcium carbonate equivalent. The quantity of carbonates (CO3) in the soil, expressed as CaCO3 and as a percentage by weight of the fraction less than 2 millimeters in size.

Cambic horizon. A mineral soil horizon that is loamy very fine sand or finer textured and has soil structure rather than rock structure. The cambic horizon contains some weatherable minerals, and it is characterized by alterations or removals as indicated by redoximorphic features or by stronger chroma or redder hue than that of the underlying horizons.

Canopy. The leafy crown of trees or shrubs. (See Crown.)

Canyon. A long, deep, narrow valley with high, precipitous walls in an area of high local relief.

Canyonland (general landscape). A deeply dissected landscape composed dominantly of relatively narrow flood plains or valley floors, commonly with considerable outcroppings of bedrock on steep slopes, ledges, or cliffs and with broad summits or interfluves.

Capillary water. Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.

Carbonates. Chemical compounds containing the carbonate ion CO3 in combination with bases such as calcium, magnesium, potassium, and sodium.

Catena. A sequence, or “chain,” of soils on a landscape that formed in similar kinds of parent material and under similar climatic conditions but that have different characteristics as a result of differences in relief and drainage.

Cation. An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.

Cation-exchange capacity. The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.

Channeled scablands. A geographic area of unique landscape features, shallow soils, and sparse vegetation. The area has elongated bedrock-controlled erosional features as a result of flooding by glacial meltwater. Many tens of feet of loess were removed by the floodwater and many areas were scoured to bedrock, leaving behind a unique pattern of channels, pools, basins, and other features.

Channery soil material. Soil material that has, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a channer.

Chemical treatment. Control of unwanted vegetation through the use of chemicals.

Chiseling. Tillage with an implement having one or more soil-penetrating points that shatter or loosen hard, compacted layers to a depth below normal plow depth.

Clay. As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.

Clay depletions. See Redoximorphic features.

Clay film. A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.

Claypan. A dense, compact subsoil layer that contains much more clay than the overlying materials, from which it is separated by a sharply defined boundary. The layer restricts the downward movement of water through the soil. A claypan is commonly hard when dry and plastic and sticky when wet.

Climax plant community. The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.

Coarse textured soil. Sand or loamy sand.

Coarse-loamy. A loamy particle-size class that is 15 percent or more fine sand or coarser, including fragments as much as 3 inches in diameter, and is less than 18 percent clay in the fine-earth fraction.

Coarse-silty. A loamy particle-size class that is less than 15 percent fine sand or coarser, including fragments as much as 3 inches in diameter, and is less than 18 percent clay in the fine-earth fraction.

Cobble (or cobblestone). A rounded or partly rounded fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.

Cobbly soil material. Material that has 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobbly soil material has 35 to 60 percent of these rock fragments, and extremely cobbly soil material has more than 60 percent.

COLE (coefficient of linear extensibility). See Linear extensibility.

Colluvium. Unconsolidated, unsorted earth material being transported or deposited on side slopes and/or at the base of slopes by mass movement (for example, direct gravitational action) and by local, unconcentrated runoff.

Compaction. The increase in soil bulk density as a result of applied loads or pressure. Compaction reduces porosity, water infiltration, and root penetration.

Complex slope. Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.

Complex, soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.

Concretions. See Redoximorphic features.

Coniferous. Pertaining to plants of the *Coniferales* order of the *Gymnospermae* subdivision. Coniferous plants have cone fruit and are commonly, but not always, evergreen. Examples include ponderosa pine, Douglas-fir, and western larch.

Conservation cropping system. Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soil-improving crops and practices more than offset the effects of the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-improving practices in a conservation cropping system include the use of rotations that contain grasses and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.

Conservation tillage. A tillage system that does not invert the soil and that leaves a protective amount of crop residue on the surface throughout the year.

Consistence, soil. Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the “Soil Survey Manual.”

Consociation. A kind of soil map unit that is dominantly a single soil or miscellaneous area and similar soils.

Continental glaciation. Refers to the glaciers that covered much of North America during the Ice Age, as opposed to contemporary glaciers associated with mountains.

Control section. The part of the soil on which classification is based. The thickness varies among different kinds of soil, but for many it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.

Cordilleran ice sheet. The glacial ice sheet that covered much of the northern half of North America, from the eastern face of the Rocky Mountains to the Pacific Ocean, during the Pleistocene.

Corrosion (soil survey interpretations). Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.

Cover crop. A close-growing crop grown primarily to improve and protect the soil between periods of regular crop production, or a crop grown between trees and vines in orchards and vineyards.

Creep. Gradual downslope movement of soil material. It is caused by gravity but is facilitated by saturation of the material with water and by alternate freezing and thawing.

Crop residue management. Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.

Cropping system. Growing crops according to a planned system of rotation and management practices.

Cross-slope farming. Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.

Crown. The upper part of a tree or shrub, including the living branches and their foliage.

Cryic. A soil temperature regime in which the mean annual soil temperature at a depth of 20 inches ranges from 33 to 46 degrees F. The mean summer soil temperature is less than 47 degrees for soils that have an O horizon, and it is less than 59 degrees for soils that do not have an O horizon.

Culmination of the mean annual increment (CMAI). The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

Cutbanks cave (in tables). The walls of excavations tend to cave in or slough.

Decreasers. The most heavily grazed climax range plants. Because they are the most palatable, they are the first to be destroyed by overgrazing.

Deferred grazing. Postponing grazing or resting grazing land for a prescribed period.

Dense layer (in tables). A very firm, massive layer that has a bulk density of more than 1.8 grams per cubic centimeter. Such a layer affects the ease of digging and can affect filling and compacting.

Densic contact. A boundary between soil and coherent underlying material that restricts the penetration of roots, is not cemented, and is typically referred to as dense glacial till and as a Cd horizon.

Depth, soil. Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

Depression. Any relatively sunken part of the earth's surface, especially a low-lying area surrounded by higher ground, that has few, if any, surface drainage outlets.

Diagnostic horizons. Combinations of specific soil characteristics that are indicative of certain classes of soils. Those that occur at the soil surface are called epipedons, and those that occur below the soil surface are called diagnostic subsurface horizons.

Dissimilar soils. Soils that behave differently and require different management than the named soils and similar soils in a map unit.

Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized—*excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained,* and *very poorly drained*. These classes are defined in the "Soil Survey Manual."

Drainage, surface. Runoff, or surface flow of water, from an area.

Drainageway. A general term for a course or channel along which water moves in draining an area. A term restricted to relatively small, linear depressions that at some time move concentrated water and either do not have a defined channel or have only a small defined channel.

Draw. A small stream valley that generally is shallower and more open than a ravine or gulch and that has a broader bottom. The present stream channel may appear inadequate to have cut the drainageway that it occupies.

Drift. A general term applied to all mineral material (clay, silt, sand, gravel, and boulders) transported by a glacier and deposited directly by or from the ice or transported by running water emanating from a glacier. Drift includes unstratified material (till) that forms moraines and stratified deposits that form outwash plains, eskers, kames, varves, and glaciofluvial sediments. The term is generally applied to Pleistocene glacial deposits in areas that no longer contain glaciers.

Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.

Dune. A low mound, ridge, bank, or hill of loose, windblown granular material (generally sand), either barren and capable of movement from place to place or covered and stabilized with vegetation but retaining its characteristic shape.

Durinodes. Nodules that are weakly cemented to indurated with silica oxide (SiO2).

Duripan. A subsurface soil horizon that is cemented by illuvial silica, commonly opal or microcrystalline forms of silica, to the degree that less than 50 percent of the volume of air-dry fragments will slake in water or hydrochloric acid.

Ecological site. An area where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. An ecological site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other ecological sites in kind and/or proportion of species or in total production.

Effervescence. The gaseous response exhibited as bubbles on the soil ped when drops of dilute (1:10) hydrochloric acid (HCl) are applied. This response typically indicates the presence of calcium carbonates (CaCO3).

Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.

Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian deposit. Sand-, silt-, or clay-sized clastic material transported and deposited primarily by wind, commonly in the form of a dune or a sheet of sand or loess.

Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.

Erratic. Refers to a rock fragment transported by glacial ice or floating ice that is different from the bedrock in the area in which it is deposited.

Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.

Erosion (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.

Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

Erosion surface. A land surface shaped by the action of erosion, especially by running water.

Escarpment. A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. Most commonly applied to cliffs produced by differential erosion. Synonym: scarp.

Extrusive rock. Igneous rock derived from deep-seated molten matter (magma) deposited and cooled on the earth's surface.

Fallow. Cropland left idle in order to restore productivity through accumulation of moisture. Summer fallow is common in regions of limited rainfall where cereal grain is grown. The soil is tilled for at least one growing season for weed control and decomposition of plant residue.

Fertility, soil. The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.

Fibric soil material (peat). The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.

Field moisture capacity. The moisture content of a soil, expressed as a percentage of the ovendry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity, normal moisture capacity,* or *capillary capacity*.

Fine textured soil. Sandy clay, silty clay, or clay.

Fine-loamy. A loamy particle-size class that is 15 percent or more fine sand or coarser, including fragments as much as 3 inches in diameter, and is 18 to 34 percent clay in the fine-earth fraction.

Fine-silty. A loamy particle-size class that is less than 15 percent fine sand or coarser, including fragments as much as 3 inches in diameter, and is 18 to 34 percent clay in the fine-earth fraction.

Flaggy soil material. Material that has, by volume, 15 to 35 percent flagstones. Very flaggy soil material has 35 to 60 percent flagstones, and extremely flaggy soil material has more than 60 percent flagstones.

Flagstone. A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.

Flood plain. The nearly level plain that borders a stream and is subject to flooding unless protected artificially.

Flood-plain step. An essentially flat, terrace-like alluvial surface within a valley that is frequently covered by floodwater from the present stream; any approximately

horizontal surface still actively modified by fluvial scour and/or deposition. May occur individually or as a series of steps.

Fluvial. Of or pertaining to rivers or streams; produced by stream or river action.

Foliated. Refers to metamorphic rock that exhibits parallel structure or layering.

Foothills. A region of steeply sloping hills that fringes a mountain range or high-plateau escarpment. The hills have relief of as much as 1,000 feet (300 meters).

Footslope. The concave surface at the base of a hillslope. A footslope is a transition zone between upslope sites of erosion and transport (shoulders and backslopes) and downslope sites of deposition (toeslopes).

Forb. Any herbaceous plant not a grass or a sedge.

Forest cover. All trees and other woody plants (underbrush) covering the ground in a forest.

Forest type. A stand of trees similar in composition and development because of given physical and biological factors by which it may be differentiated from other stands.

Forestland. Land on which the historic vegetation was dominated by a 25 percent overstory canopy cover of trees, as determined by crown perimeter-vertical projection. A tree is defined as a woody-stemmed plant that can grow to 4 meters (about 13 feet) in height at maturity.

Fragipan. A loamy, brittle subsurface horizon low in porosity and content of organic matter and low or moderate in clay but high in silt or very fine sand. A fragipan appears cemented and restricts roots. When dry, it is hard or very hard and has a higher bulk density than the horizon or horizons above. When moist, it tends to rupture suddenly under pressure rather than to deform slowly.

Fragmental. A particle-size class used to classify mineral soils that have less than 10 percent by volume fine-earth soil material.

Frigid. A soil temperature regime in which the mean annual soil temperature at a depth of 20 inches ranges from 33 to 46 degrees F. The mean summer soil temperature is more than 47 degrees for soils that have an O horizon. The difference between the mean winter soil temperature and the mean summer soil temperature is more than 9 degrees F.

Genesis, soil. The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.

Geomorphic surface. A mappable area of the earth's surface that has a common history; the area is of similar age and is formed by a set of processes during an episode of landscape evolution.

Glaciofluvial deposits. Material moved by glaciers and subsequently sorted and deposited by streams flowing from the melting ice. The deposits are stratified and occur in the form of outwash plains, valley trains, deltas, kames, eskers, and kame terraces.

Glaciolacustrine deposits. Material ranging from fine clay to sand derived from glaciers and deposited in glacial lakes mainly by glacial meltwater. Many deposits are bedded or laminated.

Gleyed soil. Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.

Granite. A coarse-grained igneous rock consisting mainly of quartz and feldspar, with more orthoclase than plagioclase. (See Granodiorite.)

Granitic. Term generally applied to granite or granitelike rock. It is used when referring to granite, granodiorite, quartz monzonite, quartz diorite, diorite, and granitic gneiss.

Granitic gneiss. A crystalline, banded metamorphic rock of granitic composition.

Granodiorite. A coarse-grained igneous rock consisting mainly of quartz and feldspar, with more plagioclase than orthoclase. (See Granite.)

Grassed waterway. A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.

Gravel. Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6 centimeters) in diameter. An individual piece is a pebble.

Gravelly soil material. Material that has 15 to 35 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.

Grazing system, planned. A system for managing rangeland in which three or more fields are alternately grazed and then rested in a planned sequence for a period of years.

Green manure crop (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.

Ground water. Water filling all the unblocked pores of the material below the water table.

Grus. The fundamental products of *in situ* granular disintegration of granite and granitic rock, dominated by intercrystal disintegration.

Gully. A small channel with steep sides caused by erosion and cut in unconsolidated materials by concentrated but intermittent flow of water. The distinction between a gully and a rill is one of depth. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.

Gypsum. A mineral consisting of hydrous calcium sulfate.

Habitat type. The collective area occupied by a single plant association. It is defined and described on the basis of the vegetation and its associated environment.

Hard bedrock. Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.

Hard to reclaim (in tables). Reclamation is difficult after the removal of soil for construction and other uses. Revegetation and erosion control are extremely difficult.

Hardpan. A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.

Head slope (geomorphology). A geomorphic component of hills consisting of a laterally concave area of a hillside, especially at the head of a drainageway. The overland waterflow is converging.

Hemic soil material (mucky peat). Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.

High-residue crops. Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.

Hill. A generic term for an elevated area of the land surface, rising as much as 1,000 feet above surrounding lowlands, commonly of limited summit area and having a well defined outline. Slopes are generally more than 15 percent. The distinction between a hill and a mountain is arbitrary and may depend on local usage.

Hillslope. A generic term for the steeper part of a hill between its summit and the drainage line, valley flat, or depression floor at the base of a hill.

Histic epipedon. A thin, organic soil horizon that is saturated with water at some time during the year unless it is artificially drained. This horizon is at or near the surface of a mineral soil. It contains more than 12 percent organic carbon.

Historic climax plant community. The plant community that was best adapted to the unique combination of factors associated with the ecological site. It was in a

natural dynamic equilibrium with the historic biotic, abiotic, and climatic factors on its ecological site in North America at the time of European immigration and settlement.

Holocene. The epoch of the Quaternary period of geologic time, extending from the end of the Pleistocene (about 10,000 to 12,000 years ago) to the present.

Horizon, soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. An explanation of the subdivisions is given in the "Soil Survey Manual." The major horizons of mineral soil are as follows:

O horizon.—An organic layer of fresh and decaying plant residue.

A horizon.—The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.

E horizon.—The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.

B horizon.—The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.

C horizon.—The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cd horizon.—Noncemented, root-restricting layer such as dense basal till.

Cr horizon.—Consolidated bedrock beneath the soil that has an extremely weakly cemented to moderately cemented rupture-resistance class.

R horizon.—Consolidated bedrock beneath the soil that has a strongly cemented or stronger rupture-resistance class.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties include depth to a seasonal high water table, the infiltration rate, and depth to a layer that significantly restricts the downward movement of water. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Igneous rock. Rock that was formed by cooling and solidification of magma and that has not been changed appreciably by weathering since its formation. Major varieties include plutonic and volcanic rock (e.g., andesite, basalt, and granite).

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Increasers. Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasers commonly are the shorter plants and the less palatable to livestock.

Indurated. Refers to having a hard, brittle consistency as a result of particles being held together by cementing substances such as silica, calcium carbonate, and iron. An indurated layer can be broken by a sharp blow of a hammer.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.2	very low
0.2 to 0.4	low
0.4 to 0.75	moderately low
0.75 to 1.25	moderate
1.25 to 1.75	moderately high
1.75 to 2.5	high
More than 2.5	very high

Interfluve. A landform composed of the relatively undissected upland or ridge between two adjacent valleys containing streams flowing in the same general direction. An elevated area between two drainageways that sheds water to those drainageways.

Interfluve (geomorphology). A geomorphic component of hills consisting of the uppermost, comparatively level or gently sloping area of a hill; shoulders of backwearing hillslopes can narrow the upland or can merge, resulting in a strongly convex shape.

Intrusive rock. Igneous rock derived from molten matter (magmas) that invaded pre-existing rock and cooled below the surface of the earth.

Invaders. On range, plants that encroach into an area and grow after the climax vegetation has been reduced by grazing. Generally, plants invade following disturbance of the surface.

Iron accumulations. See Redoximorphic features.

Iron depletions. See Redoximorphic features.

Irrigation. Application of water to soils to assist in production of crops. Methods of irrigation are:

Basin.—Water is applied rapidly to nearly level plains surrounded by levees or dikes.

Border.—Water is applied at the upper end of a strip in which the lateral flow of water is controlled by small earth ridges called border dikes, or borders.

Controlled flooding.—Water is released at intervals from closely spaced field ditches and distributed uniformly over the field.

Corrugation.—Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.

Drip (or trickle).—Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.

Furrow.—Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.

Sprinkler.—Water is sprayed over the soil surface through pipes or nozzles from a pressure system.

Subirrigation.—Water is applied in open ditches or tile lines until the water table is raised enough to wet the soil.

Wild flooding.—Water, released at high points, is allowed to flow onto an area without controlled distribution.

Krotovinas. Irregular tubular streaks within one layer of soil material transported from another layer. They are caused by the filling of tunnels made by burrowing animals.

Ksat. See Saturated hydraulic conductivity.

Lacustrine deposit. Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.

Lake plain. A nearly level surface marking the floor of an extinct lake filled by well sorted, generally fine textured, stratified deposits, commonly containing varves.

Lake terrace. A narrow shelf, partly cut and partly built, produced along a lakeshore in front of a scarp line of low cliffs and later exposed when the water level falls.

Lamella. A thin, discontinuous or continuous, generally horizontal layer of fine material (especially clay and iron oxides) that has been pedogenically concentrated (illuviated) within a coarser (e.g., sandy), eluviated layer.

Landform. Any physical, recognizable form or feature on the earth's surface that has a characteristic shape and range in composition and is produced by natural causes; it can span a wide range in size. Landforms provide an empirical description of similar portions of the earth's surface.

Landscape (soils). An assemblage, group, or family of spatially related, natural landforms over a relatively large area; the land surface which the eye can comprehend in a single view.

Landslide. A general, encompassing term for most types of mass movement landforms and processes involving the downslope transport and outward deposition of soil and rock materials caused by gravitational forces; the movement may or may not involve saturated materials. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

Large stones (in tables). Rock fragments 3 inches (7.6 centimeters) or more across. Large stones adversely affect the specified use of the soil.

Leaching. The removal of soluble material from soil or other material by percolating water.

Leeward. Being in or facing the direction toward which the wind is blowing.

Limestone. Sedimentary rock consisting mainly of calcium carbonate (CaCO3).

Linear extensibility. Refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. Linear extensibility is used to determine the shrink-swell potential of soils. It is an expression of the volume change between the water content of the clod at $^1/_3$- or $^1/_{10}$-bar tension (33kPa or 10kPa tension) and oven dryness. Volume change is influenced by the amount and type of clay minerals in the soil. The volume change is the percent change for the whole soil. If it is expressed as a fraction, the resulting value is COLE, coefficient of linear extensibility.

Liquid limit. The moisture content at which the soil passes from a plastic to a liquid state.

Lithic contact. A boundary between soil and coherent underlying material, typically bedrock. The bedrock has a cementation class of strongly cemented or stronger and is typically referred to as an R horizon.

Lithologic discontinuity. A significant change in particle-size distribution or mineralogy that indicates a difference in the material from which the soil horizons have formed.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loamy-skeletal. A particle-size class in which rock fragments 2 millimeters in diameter or larger make up 35 percent or more by volume. The fine-earth fraction is loamy.

Loess. Material transported and deposited by wind and consisting dominantly of silt-sized particles.

Low strength. The soil is not strong enough to support loads.

Low-residue crops. Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.

Major land resource area (MLRA). A broad geographic land area characterized by a particular pattern of soils, geology, climate, water resources, and land use. An area is typically continuous, but small separate areas can occur.

Mass movement. A generic term for the dislodgment and downslope transport of soil and rock material as a unit under direct gravitational stress.

Masses. See Redoximorphic features.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medial (family particle-size class). A substitute class term used for the family particle-size class in mineral soils.

Medial (textural modifier, such as medial loam). A USDA textural modifier used in conjunction with a USDA mineral soil texture to indicate unique physical and chemical properties. The properties are defined in Soil Taxonomy and are typically low bulk density, high content of iron and aluminum, and high retention of phosphate.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Mesic. A soil temperature regime in which the mean annual temperature at a depth of 20 inches ranges from 47 to 58 degrees F. The difference between the mean winter soil temperature and the mean summer soil temperature is more than 9 degrees F.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement at depth in the earth's crust. Nearly all such rocks are crystalline.

Metasedimentary rock. A sedimentary rock that has been subject to metamorphic processes. The degree of metamorphic alteration is not implied by the term.

Microclimate. The climate of a small distinct area, as of a forest or city, or a confined space, as of a building or greenhouse.

Mine spoil. An accumulation of displaced earthy material, rock, or other waste material removed during mining or excavation. Also called earthy fill.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Minimum tillage. Only the tillage essential to crop production and prevention of soil damage.

Miscellaneous area. A kind of map unit component that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Moisture control section. The layer within a soil profile used to determine the soil moisture regime. The upper boundary is the depth to which a dry soil is moistened by 1 inch of water in 24 hours. The lower boundary is the depth to which a dry soil is moistened by 3 inches of water in 48 hours.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Moraine. In terms of glacial geology, a mound, ridge, or other topographically distinct accumulation of unsorted, unstratified drift, predominantly till, deposited primarily by the direct action of glacial ice in a variety of landforms. Also, a general term for a landform composed mainly of till (except for kame moraines, which are composed mainly of stratified outwash) that has been deposited by a glacier. Some types of moraines are disintegration, end, ground, kame, lateral, recessional, and terminal.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mottling, soil. Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance—*few, common,* and *many;* size—*fine, medium,* and *coarse;* and contrast—*faint, distinct,* and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine* indicates less than 5 millimeters (about 0.2 inch); *medium,* from 5 to 15 millimeters (about 0.2 to 0.6 inch); and *coarse,* more than 15 millimeters (about 0.6 inch).

Mountain. A generic term for an elevated area of the land surface, rising more than 1,000 feet (300 meters) above surrounding lowlands, commonly of restricted summit area (relative to a plateau) and generally having steep sides. A mountain can occur as a single, isolated mass or in a group forming a chain or range. Mountains are formed primarily by tectonic activity and/or volcanic action but can also be formed by differential erosion.

Mountain valleys. Any small, externally drained depression floored with either till or alluvium, that occurs on a mountain or within mountains. (See intermontane basins.)

Muck. Dark, finely divided, well decomposed organic soil material. (See Sapric soil material.)

Mucky peat. A USDA texture associated with organic soils that meet the degree of organic matter decomposition associated with hemic soil material.

Munsell notation. A designation of color by degrees of three simple variables—hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Neutral soil. A soil having a pH value of 6.6 to 7.3. (See Reaction, soil.)

Nodules. See Redoximorphic features.

Nose slope (geomorphology). A geomorphic component of hills consisting of the projecting end (laterally convex area) of a hillside. The overland waterflow is predominantly divergent. Nose slopes consist dominantly of colluvium and slope-wash sediments (for example, slope alluvium).

Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

Ochric epipedon. A surface horizon of mineral soil that is too light in color, too high in chroma, too low in organic carbon, or too thin to be a mollic, umbric, or histic epipedon.

Organic matter. Plant and animal residue in the soil in various stages of decomposition. The content of organic matter in the surface layer is described as follows:

Very low	less than 0.5 percent
Low	0.5 to 1.0 percent
Moderately low	1.0 to 2.0 percent
Moderate	2.0 to 4.0 percent
High	4.0 to 8.0 percent
Very high	more than 8.0 percent

Orogenic. Of or pertaining to the process of mountain formation.

Outwash. Stratified and sorted sediment (mainly sand and gravel) removed or "washed out" from a glacier by meltwater streams and deposited in front of or beyond the end moraine or the margin of a glacier. The coarser material is deposited nearer to the ice.

Outwash fan. An accumulation of outwash material deposited by meltwater streams in front of the end or recessional moraine of a glacier.

Outwash plain. An extensive lowland area of coarse textured glaciofluvial material. An outwash plain is commonly smooth; where pitted, it generally is low in relief.

Outwash terrace. A valley train deposit extending along a valley downstream from an outwash plain or terminal moraine; a flat-topped bank of outwash with an abrupt outer face.

Overland flow. Water that runs across the land after rainfall, either before it enters a watercourse or after it leaves a watercourse as floodwater or after it rises to the surface naturally from underground.

Overstory. The trees in a forest stand that form the upper crown cover. (See Understory.)

Oxidation. Any chemical reaction that removes electrons from a molecule or atom.

Paleosol. A soil that formed on a landscape in the past that has distinctive morphological features resulting from a soil-forming environment that no longer exists.

Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, *hardpan, fragipan, claypan, duripan, placic horizon, plowpan,* and *traffic pan*.

Paralithic contact. A boundary between soil and coherent underlying material that can be dug with difficulty with a spade. It is referred to as weathered bedrock, has a cementation class of moderately cemented or weaker, and is typically referred to as a Cr horizon.

Pararock fragments. Fragments of rock that are 2 millimeters in diameter or more (e.g., paragravel, paracobble, or parastone). Pararock fragments have a moderately cemented to extremely weakly cemented rupture-resistance class.

Parent material. The unconsolidated organic and mineral material in which soil forms.

Peat. Unconsolidated material, largely undecomposed organic matter, that has accumulated under excess moisture. (See Fibric soil material.)

Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.

Pedogenesis. The processes of formation and development of soils.

Pedologic. Of or pertaining to the processes of soil formation.

Pedon. The smallest volume that can be called "a soil." A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

Percolation. The movement of water through the soil.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual" and in this

glossary. Terms describing permeability, measured in inches per hour, are as follows:

Impermeable	less than 0.0015 inch
Very slow	0.0015 to 0.06 inch
Slow	0.06 to 0.2 inch
Moderately slow	0.2 to 0.6 inch
Moderate	0.6 inch to 2.0 inches
Moderately rapid	2.0 to 6.0 inches
Rapid	6.0 to 20 inches
Very rapid	more than 20 inches

See “Saturated hydraulic conductivity” for conversions of inches per hour to micrometers per second.

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

Piping (in tables). Formation of subsurface tunnels or pipelike cavities by water moving through the soil.

Pitting (in tables). Pits caused by melting around ice. They form on the soil after plant cover is removed.

Plant association. A kind of climax plant community consisting of stands with essentially the same dominant species in corresponding layers.

Plant community. An assemblage of plants living together, reflecting no particular ecological status; a vegetative complex unique in its combination of plants.

Plastic limit. The moisture content at which a soil changes from semisolid to plastic.

Plasticity index. The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.

Plateau (geomorphology). A comparatively flat area of great extent and elevation; specifically, an extensive land region that is considerably elevated (more than 100 meters) above the adjacent lower lying terrain, is commonly limited on at least one side by an abrupt descent, and has a flat or nearly level surface. A comparatively large part of a plateau surface is near summit level.

Pleistocene. The epoch of geologic time from approximately 10,000 to 2 million years ago. The earlier of the two epochs comprising the Quaternary period. Also called the Glacial epoch.

Plowpan. A compacted layer formed in the soil directly below the plowed layer.

Pole stage. A forest successional stage in which the vegetation of a stand is dominantly a moderately dense to very dense overstory of trees that have minimal vertical crown depth. The trees generally range from about 5 to 9 inches in diameter at breast height, and the canopy cover normally exceeds 35 percent.

Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.

Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.

Pore linings. See Redoximorphic features.

Potential native plant community. See Climax plant community.

Potential rooting depth (effective rooting depth). Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.

Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.

Productivity, soil. The capability of a soil for producing a specified plant or sequence of plants under specific management.

Profile, soil. A vertical section of the soil extending through all its horizons and into the parent material.

Proper grazing use. Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.

Quartz monzonite. A coarse-grained igneous rock consisting mainly of plagioclase, orthoclase, and quartz with minor amounts of biotite and hornblende. (See Granite and Granodiorite.)

Quartzite. A nonfoliated metamorphic rock consisting mainly of quartz sand cemented with quartz.

Quaternary. The period of the Cenozoic era of geologic time, extending from the end of the Tertiary (about 2 million years ago) to the present and comprising two epochs, the Pleistocene (Ice Age) and the Holocene (Recent).

Rangeland. Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs suitable for grazing or browsing. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.

Reaction, soil. A measure of acidity or alkalinity of a soil, expressed as pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid	less than 3.5
Extremely acid	3.5 to 4.4
Very strongly acid	4.5 to 5.0
Strongly acid	5.1 to 5.5
Moderately acid	5.6 to 6.0
Slightly acid	6.1 to 6.5
Neutral	6.6 to 7.3
Slightly alkaline	7.4 to 7.8
Moderately alkaline	7.9 to 8.4
Strongly alkaline	8.5 to 9.0
Very strongly alkaline	9.1 and higher

Redoximorphic concentrations. See Redoximorphic features.

Redoximorphic depletions. See Redoximorphic features.

Redoximorphic features. Redoximorphic features are associated with wetness and result from alternating periods of reduction and oxidation of iron and manganese compounds in the soil. Reduction occurs during saturation with water, and oxidation occurs when the soil is not saturated. Characteristic color patterns are created by these processes. The reduced iron and manganese ions may be removed from a soil if vertical or lateral fluxes of water occur, in which case there is no iron or manganese precipitation in that soil. Wherever the iron and manganese are oxidized and precipitated, they form either soft masses or hard concretions or nodules. Movement of iron and manganese as a result of redoximorphic processes in a soil may result in redoximorphic features that are defined as follows:

1. Redoximorphic concentrations.—These are zones of apparent accumulation of iron-manganese oxides, including:

   A. Nodules and concretions, which are cemented bodies that can be removed from the soil intact. Concretions are distinguished from nodules on the basis of internal organization. A concretion typically has concentric layers that are visible to the naked eye. Nodules do not have visible organized internal structure; *and*

B. Masses, which are noncemented concentrations of substances within the soil matrix; *and*

C. Pore linings, i.e., zones of accumulation along pores that may be either coatings on pore surfaces or impregnations from the matrix adjacent to the pores.

2. Redoximorphic depletions.—These are zones of low chroma (chroma less than that of the matrix) where either iron-manganese oxides alone or both iron-manganese oxides and clay have been stripped out, including:

A. Iron depletions, i.e., zones that contain low amounts of iron and manganese oxides but have a clay content similar to that of the adjacent matrix; *and*

B. Clay depletions, i.e., zones that contain low amounts of iron, manganese, and clay (often referred to as silt coatings or skeletans).

3. Reduced matrix.—This is a soil matrix that has low chroma *in situ* but undergoes a change in hue or chroma within 30 minutes after the soil material has been exposed to air.

Reduced matrix. See Redoximorphic features.

Reduction. Any chemical reaction in which there is uptake of an electron by a molecule or atom.

Regolith. All unconsolidated earth materials above the solid bedrock. It includes material weathered in place from all kinds of bedrock and alluvial, glacial, eolian, lacustrine, and pyroclastic deposits.

Relief. The relative difference in elevation between the upland summits and the lowlands or valleys of a given region.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as bedrock disintegrated in place.

Restrictive feature. A nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly reduce the movement of water and/or air through the soil or that otherwise provide an unfavorable root environment.

Rill. A very small, steep-sided channel resulting from erosion and cut in unconsolidated materials by concentrated but intermittent flow of water. A rill generally is not an obstacle to wheeled vehicles and is shallow enough to be smoothed over by ordinary tillage.

Riparian. Refers to areas adjacent to water or wetlands; vegetation is dependent on water or use and management directly impacts the water or wetlands.

Riser. The vertical or steep side slope (e.g., escarpment) of terraces, flood-plain steps, or other stepped landforms; commonly a recurring part of a series of natural, steplike landforms, such as successive stream terraces.

Riverwash. Unstable areas of sandy, silty, clayey, gravelly, and cobbly sediment. These areas are flooded, washed, and reworked by rivers so frequently that they support little or no vegetation.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments that are 2 millimeters in diameter or more (i.e., gravel, cobbles, stones, and boulders). Rock fragments have a strongly cemented or stronger rupture-resistance class.

Rock outcrop. Exposures of bare bedrock.

Rubble land. Areas that consist of cobbles, stones, and boulders, commonly at the base of mountains.

Root zone. The part of the soil that can be penetrated by plant roots.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface

runoff. Water that enters the soil before reaching surface streams is called ground-water runoff or seepage flow from ground water.

Saline soil. A soil containing soluble salts in an amount that impairs growth of plants. A saline soil does not contain excess exchangeable sodium.

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy. A particle-size class in which the texture of the fine-earth fraction is sand or loamy sand but not loamy very fine sand or very fine sand; it is less than 35 percent rock fragments by volume.

Sandy-skeletal. A particle-size class that is 35 percent or more, by volume, rock fragments 2 millimeters in diameter or larger. The fine-earth fraction is sandy.

Sapling/pole stage. A forest successional stage in which the vegetation of a stand is dominantly saplings and pole-sized trees (generally 2 to 9 inches in diameter at breast height). The canopy cover and understory production are intermediate between the herbaceous or shrub stage and the pole stage.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

Saprolite. Soft, friable bedrock that retains the fabric and structure of the parent rock while exhibiting weathering of crystals.

Saturated hydraulic conductivity (Ksat). The ease with which pores of a saturated soil transmit water. Formally, the proportionality coefficient that expresses the relationship of the rate of water movement to hydraulic gradient in Darcy's Law, a law that describes the rate of water movement through porous media. Commonly abbreviated as "Ksat." Terms describing saturated hydraulic conductivity are *very high*, 100 or more micrometers per second (14.17 or more inches per hour); *high*, 10 to 100 micrometers per second (1.417 to 14.17 inches per hour); *moderately high*, 1 to 10 micrometers per second (0.1417 inch to 1.417 inches per hour); *moderately low*, 0.1 to 1 micrometer per second (0.01417 to 0.1417 inch per hour); *low*, 0.01 to 0.1 micrometer per second (0.001417 to 0.01417 inch per hour); and *very low*, less than 0.01 micrometer per second (less than 0.001417 inch per hour). To convert inches per hour to micrometers per second, multiply inches per hour by 7.0572. To convert micrometers per second to inches per hour, multiply micrometers per second by 0.1417.

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Schist. A medium- to coarse-grained foliated metamorphic rock in which the platy minerals are clearly visible. Micaceous minerals commonly are present.

Secondary carbonates and silica. Calcium carbonate and silica weathered from the soil matrix in the upper part of the soil and then transported and deposited in the lower part by water moving through the soil profile.

Sedimentary rock. A consolidated deposit of clastic particles, chemical precipitates, or organic remains accumulated at or near the surface of the earth under normal low temperature and pressure conditions. Sedimentary rocks include consolidated equivalents of alluvium, colluvium, drift, and eolian, lacustrine, and marine deposits. Examples are sandstone, siltstone, mudstone, claystone, shale, conglomerate, limestone, dolomite, and coal.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Seral. Refers to the relative transitory aggregation of plants and animals within a sere; a preclimax stage of succession.

Seral species. A species associated with the early or middle stages of ecological succession.

Seral stand. A vegetative community composed of seral species.

Sere. The stages in an ecological succession.

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shoulder. The convex, erosional surface near the top of a hillslope. A shoulder is a transition from summit to backslope.

Shrink-swell (in tables). The shrinking of soil when dry and the swelling when wet. Shrinking and swelling can damage roads, dams, building foundations, and other structures. It can also damage plant roots.

Side slope (geomorphology). A geomorphic component of hills consisting of a laterally planar area of a hillside. The overland waterflow is predominantly parallel. Side slopes are dominantly colluvium and slope-wash sediments.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, classes for simple slopes are as follows:

Level	0 to 2 percent
Gently sloping	2 to 5 percent
Moderately sloping	5 to 15 percent
Moderately steep	15 to 30 percent
Steep	30 to 60 percent
Very steep	60 percent and higher

Slope alluvium. Sediment gradually transported down the slopes of mountains or hills primarily by nonchannel alluvial processes (i.e., slope-wash processes) and characterized by particle sorting. Lateral particle sorting is evident on long slopes. In a profile sequence, sediments may be distinguished by differences in size and/or specific gravity of rock fragments and may be separated by stone lines. Burnished peds and sorting of rounded or subrounded gravel or cobbles distinguish these materials from unsorted colluvial deposits.

Slow refill (in tables). The slow filling of ponds, resulting from restricted water transmission in the soil.

Slow water movement (in tables). Restricted downward movement of water through the soil. (See Saturated hydraulic conductivity.)

Slump. A mass movement process characterized by a landslide involving shearing and rotary movement of a generally independent mass of rock or earth along a curved slip surface. The mass (slump) has its axis parallel to the slope from which it descends. A slump surface commonly exhibits a reversed slope facing uphill.

Sodic (alkali) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Sodium adsorption ratio (SAR). A measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg concentration.

Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief and by the passage of time.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand	0.25 to 0.10
Very fine sand	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Stone line. In a vertical cross section, a line formed by scattered fragments or a discrete layer of angular and subangular rock fragments (commonly a gravel- or cobble-sized lag concentration) that formerly was draped across a topographic surface and was later buried by additional sediments. A stone line generally caps material that was subject to weathering, soil formation, and erosion before burial. Many stone lines seem to be buried erosion pavements, originally formed by sheet and rill erosion across the land surface.

Stones. Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.

Stoniness (or boulderiness). The relative proportion of larger rock fragments on the surface layer. Used as map unit phase designation for soils containing sufficient amounts of stones and boulders to impose important restrictions on use and management. These phases should not be confused with the use of fragments as textural modifiers. The four phases recognized in this survey are:

Stony (or bouldery).—The areas have enough stones and boulders at or near the surface to be a continuing nuisance during operations that mix the surface layer, but they do not make most such operations impractical. Conventional, wheeled vehicles can move with reasonable freedom over the area. Rocks may damage both the equipment that mixes the soil and the vehicles that move on the surface. Large rock fragments cover about 0.01 to 0.1 percent of the surface.

Very stony (or very bouldery).—The areas have so many stones and boulders at or near the surface that operations that mix the surface layer either require heavy

equipment or use of implements that can operate between the larger ones. Tillage with conventionally powered farm equipment is impractical. Wheeled tractors and vehicles with high clearance can operate on carefully chosen routes over and around stones and boulders. Large rock fragments cover about 0.1 to 3 percent of the surface.

Extremely stony (or extremely bouldery).—The areas have so many stones and boulders at or near the surface that wheeled powered equipment, other than some special types, can operate only along selected routes. Tracked vehicles can be used in most places, although some routes have to be cleared. Large rock fragments cover about 3 to 15 percent of the surface.

Rubbly and very rubbly.—The areas have so many stones and boulders at or near the surface that tracked vehicles cannot be used in most places. Large rock fragments cover about 15 to 90 percent of the surface.

Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.

Stream terrace. One of a series of platforms in a stream valley, flanking and more or less parallel to the stream channel. Originally formed near the level of the stream. Represents the remnants of an abandoned flood plain, streambed, or valley floor produced during a former state of fluvial erosion or deposition.

Stripcropping. Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to wind erosion and water erosion.

Structure, soil. The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are—*platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grained* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

Stubble mulch. Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind erosion and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.

Subaqueous. Refers to conditions and processes, features, or deposits that exist in or under water, especially fresh water, as in a lake or stream.

Subduction. The process of one lithospheric plate descending beneath another.

Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.

Subsoiling. Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.

Substratum. The part of the soil below the solum.

Subsurface layer. Technically, the E horizon. Generally refers to a leached horizon that is lighter in color and lower in content of organic matter than the overlying surface layer.

Summer fallow. The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.

Summit. The topographically highest position of a hillslope. It has a nearly level (planar or only slightly convex) surface.

Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the “plow layer,” or the “Ap horizon.”

Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.

Talus. Rock fragments of any size or shape (commonly coarse and angular) derived from and lying at the base of a cliff or very steep rock slope. The accumulated mass of such loose broken rock formed chiefly by falling, rolling, or sliding.

Taxadjuncts. Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.

Tectonic. Pertaining to the forces involved in, or the resulting structures of, deformation of the earth's crust.

Tephra. A collective term for all clastic volcanic material that is ejected from a vent during an eruption and transported through the air. It includes ash, blocks, cinders, lapilli, scoria, and pumice.

Terminal moraine. An end moraine that marks the farthest advance of a glacier. It typically has the form of a massive arcuate or concentric ridge, or complex of ridges, and is underlain by till and other types of drift.

Terrace (conservation). An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field generally is built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

Terrace. (geomorphology). A steplike surface, bordering a valley floor or shoreline, that represents the former position of a flood plain, lake, or seashore. The term is usually applied both to the relatively flat summit surface (tread) that was cut or built by stream or wave action and to the steeper descending slope (scarp or riser) that has graded to a lower base level of erosion.

Terracettes. Small, irregular steplike forms on steep hillslopes, especially in pasture, formed by creep or erosion of surficial materials that may be induced or enhanced by trampling of livestock, such as sheep or cattle.

Tertiary. The period of geologic time from approximately 2 to 63 million years ago (radiometric dates). The earlier of the two geologic periods comprising the Cenozoic era.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand, loamy sand, sandy loam, loam, silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay,* and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand, loamy sand, sandy loam, loam, silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay,* and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."

Thin layer (in tables). Otherwise suitable soil material that is too thin for the specified use.

Till. Dominantly unsorted and nonstratified drift, generally unconsolidated and deposited directly by a glacier without subsequent reworking by meltwater, and consisting of a heterogeneous mixture of clay, silt, sand, gravel, stones, and boulders; rock fragments of various lithologies are embedded within a finer matrix that can range from clay to sandy loam.

Till plain. An extensive area of level to gently undulating soils underlain predominantly by till and bounded at the distal end by subordinate recessional or end moraines.

Tilth, soil. The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.

Toeslope. The gently inclined surface at the base of a hillslope. Toeslopes in profile are commonly gentle and linear and are constructional surfaces forming the lower part of a hillslope continuum that grades to valley or closed-depression floors.

Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

Tread. The flat to gently sloping, topmost, laterally extensive slope of terraces, flood-plain steps, or other stepped landforms; commonly a recurring part of a series of natural steplike landforms, such as successive stream terraces.

Udic. A soil moisture regime common to a climate that has moisture throughout the year. The soil moisture control section is dry for less than 45 consecutive days during the 4 months following the summer solstice.

Umbric epipedon. A thick, dark-colored, humus-rich surface horizon that has low base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Understory. Plants in a forest community that grow to a height of 4.5 feet or less.

Upland. An informal, general term for the higher ground of a region, in contrast with a low-lying adjacent area, such as a valley or plain, or for land at a higher elevation than the flood plain or low stream terrace; land above the footslope zone of the hillslope continuum.

Valley fill. The unconsolidated sediment deposited by any agent (water, wind, ice, or mass wasting) so as to fill or partly fill a valley.

Variegation. Refers to patterns of contrasting colors assumed to be inherited from the parent material rather than to be the result of poor drainage.

Varve. A sedimentary layer or a lamina or sequence of laminae deposited in a body of still water within a year. Specifically, a thin pair of graded glaciolacustrine layers seasonally deposited, usually by meltwater streams, in a glacial lake or other body of still water in front of a glacier.

Volcanic ash mantle. A surface layer of soil that contains 30 percent volcanic glass or more overlying other soil material. The mantle has low bulk density and high water holding capacity.

Water bars. Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.

Weathering. All physical disintegration, chemical decomposition, and biologically induced changes in rocks or other deposits at or near the earth's surface by atmospheric or biologic agents or by circulating surface waters but involving essentially no transport of the altered material.

Well graded. Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.

Wilting point (or permanent wilting point). The moisture content of soil, on an oven-dry basis, at which a plant (specifically a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.

Windthrow. The uprooting and tipping over of trees by the wind.

Xeric. A soil moisture regime common to a climate having moist winters and dry summers. The soils are dry in the moisture control section for more than 45

consecutive days during the 4 months following the summer solstice and are moist for more than 45 consecutive days during the 4 months following the winter solstice.

Tables

Table 1.--Temperature and Precipitation

(Recorded in the period 1971 to 2000 at the Spokane Weather Service Office Airport, Washington [7938])

Month	Temperature						Precipitation				
	Average daily maximum	Average daily minimum	Average daily	2 years in 10 will have-- Maximum temperature higher than--	2 years in 10 will have-- Minimum temperature lower than--	Average number of growing degree days*	Average	2 years in 10 will have-- Less than--	2 years in 10 will have-- More than--	Average number of days with 0.10 inch or more	Average snowfall

Total-----	---	---	---	---	---	4,026	16.67	14.04	19.19	48	44.3

*A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (40 degrees F).

Table 2.--Freeze Dates in Spring and Fall

(Recorded in the period 1971-2000 at the Spokane Weather Station Office Airport, Washington [7938])

Probability	Temperature		
	24 °F or lower	28 °F or lower	32 °F or lower
Last freezing temperature in spring:			
1 year in 10 later than--	April 16	May 5	May 17
2 years in 10 later than--	April 8	April 29	May 11
5 years in 10 later than--	March 24	April 17	May 1
First freezing temperature in fall:			
1 year in 10 earlier than--	October 6	September 27	September 18
2 years in 10 earlier than--	October 12	October 3	September 23
5 years in 10 earlier than--	October 23	October 14	October 2

Table 3.--Growing Season

(Recorded in the period 1971 to 2000 at the Spokane Weather Station Office Airport, Washington [7938])

Probability	Daily minimum temperature during growing season		
	Higher than 24 °F	Higher than 28 °F	Higher than 32 °F
	Days	*Days*	*Days*
9 years in 10	183	152	130
8 years in 10	193	162	138
5 years in 10	212	179	153
2 years in 10	231	197	168
1 year in 10	241	206	176

Table 4.--Acreage and Proportionate Extent of the Soils

Map symbol	Soil name	Acres	Percent
1001	Bridgeson ashy silt loam, 0 to 3 percent slopes	1,775	0.2
1010	Caldwell-Thatuna complex, 0 to 8 percent slopes	10,917	1.0
1015	Caldwell silt loam, 0 to 3 percent slopes	1,129	*
1020	Cocolalla ashy silt loam, 0 to 3 percent slopes	8,944	0.8
1021	Cocolalla-Hardesty complex, 0 to 3 percent slopes	15,494	1.4
1030	Emdent ashy silt loam, 0 to 3 percent slopes	1,502	0.1
1040	Hardesty ashy silt loam, 0 to 3 percent slopes	3,060	0.3
1050	Hoodoo-Kronquist complex, 0 to 3 percent slopes	4,126	0.4
1070	Mondovi silt loam, 0 to 8 percent slopes	3,680	0.3
1080	Narcisse silt loam, 0 to 3 percent slopes	4,777	0.4
1081	Narcisse silt loam, 3 to 8 percent slopes	612	*
1090	Peone-Saltese complex, 0 to 3 percent slopes	1,304	0.1
1091	Peone ashy silt loam, drained, 0 to 3 percent slopes	1,177	0.1
1092	Hoodoo ashy silt loam, 0 to 3 percent slopes	1,171	0.1
1120	Lovell ashy silt loam, 0 to 3 percent slopes	925	*
1130	Colburn ashy loam, 0 to 3 percent slopes	1,363	0.1
1200	Endoaquolls and Fluvaquents, 0 to 3 percent slopes	3,163	0.3
1203	Haploxerolls ashy silt loam, channeled, 0 to 8 percent slopes	4,271	0.4
1300	Aquepts ashy loam, frigid, 0 to 3 percent slopes	2,855	0.3
2040	Klickson gravelly ashy silt loam, mass wasted, 15 to 30 percent slopes	1,855	0.2
2041	Klickson gravelly ashy silt loam, 30 to 60 percent slopes	1,973	0.2
2042	Rock outcrop-Klickson-Speigle complex, 60 to 80 percent slopes	1,247	0.1
2043	Klickson-Speigle complex, mass wasted, 15 to 30 percent slopes	5,024	0.4
2044	Klickson-Speigle complex, 30 to 60 percent slopes	1,265	0.1
2045	Marble-Speigle complex, mass wasted, 8 to 30 percent slopes	1,753	0.2
2046	Klickson-Speigle-Rock outcrop complex, 30 to 60 percent slopes	4,705	0.4
2050	Speigle cobbly ashy loam, 15 to 30 percent slopes	1,232	0.1
2051	Speigle cobbly ashy loam, 30 to 60 percent slopes	698	*
2052	Brincken, moist-Speigle complex, mass wasted, 8 to 25 percent slopes	2,732	0.2
2053	Speigle-Rock outcrop complex, 15 to 30 percent slopes	5,789	0.5
2054	Speigle-Rubble land-Rock outcrop complex, 30 to 90 percent slopes	7,861	0.7
2070	Bobbitt-Lacy complex, 0 to 8 percent slopes	2,244	0.2
2071	Bobbitt-Speigle complex, 8 to 25 percent slopes	2,969	0.3
2080	Gibbs ashy silt loam, 0 to 8 percent slopes	6,066	0.5
2081	Gibbs ashy silt loam, 8 to 15 percent slopes	2,066	0.2
2085	Tucannon ashy silt loam, 0 to 8 percent slopes	6,129	0.5
2090	Rockly-Tucannon complex, 15 to 35 percent slopes	905	*
2160	Scoap-Rubble land-Rock outcrop complex, 30 to 90 percent slopes	394	*
3010	Alecanyon cobbly ashy coarse sandy loam, 15 to 40 percent slopes, very stony surface	244	*
3015	Seaboldt ashy loam, dry, 0 to 8 percent slopes	3,425	0.3
3020	Bong ashy sandy loam, 0 to 8 percent slopes	1,836	0.2

Table 6.--Land Capability Classification and Nonirrigated Wheat Productivity Index

(Land capability in the “N” column is for nonirrigated conditions; those in the “I” column are for irrigated conditions. The crop productivity index is for nonirrigated wheat in major land resource area 9. Index values range from 0.00 to 1.00. The higher the value, the higher the productivity.)

Table 7.--Nonirrigated Hay Productivity Indices

(The indices are for major land resource areas 9, 43A, and 44A (Palouse and Nez Perce Prairies, Northern Rocky Mountains, and Mountain Valleys). Productivity index values range from 0.00 to 1.00. The higher the index value, the higher the potential productivity.)

Water	---	---	---

*Wild hay is produced on sites that are subirrigated with a naturally occurring high water table in the root zone that persists for a considerable part of the growing season. Vegetation consists of water-tolerant grasses, rushes, and sedges that occur naturally or have colonized in areas where the woody vegetation has been removed.

Table 8.--Prime and other Important Farmland

(Only the soils considered prime or important farmland are listed. Urban or built-up areas of the soils listed are not considered prime or important farmland. If a soil is prime or important farmland only under certain conditions, the conditions are specified in parentheses after the soil name.)

Map symbol	Map unit name	Farmland classification
1040	Hardesty ashy silt loam, 0 to 3 percent slopes	All areas are prime farmland
1070	Mondovi silt loam, 0 to 8 percent slopes	All areas are prime farmland
1080	Narcisse silt loam, 0 to 3 percent slopes	All areas are prime farmland
1081	Narcisse silt loam, 3 to 8 percent slopes	All areas are prime farmland
1091	Peone ashy silt loam, drained, 0 to 3 percent slopes	All areas are prime farmland
1130	Colburn ashy loam, 0 to 3 percent slopes	All areas are prime farmland
1203	Haploxerolls ashy silt loam, channeled, 0 to 8 percent slopes	All areas are prime farmland
2080	Gibbs ashy silt loam, 0 to 8 percent slopes	All areas are prime farmland
3044	Cheney ashy silt loam, 0 to 8 percent slopes	All areas are prime farmland
3046	Cheney-Seaboldt, dry, complex, 0 to 8 percent slopes	All areas are prime farmland
3070	Eloika ashy very fine sandy loam, 0 to 8 percent slopes	All areas are prime farmland
3074	Eloika ashy very fine sandy loam, moist, 0 to 8 percent slopes	All areas are prime farmland
3090	Glenrose ashy silt loam, 0 to 8 percent slopes	All areas are prime farmland
3101	Green Bluff ashy silt loam, 0 to 8 percent slopes	All areas are prime farmland
3500	Uhlig ashy silt loam, 0 to 8 percent slopes	All areas are prime farmland
3501	Brincken, moist-Uhlig complex, 0 to 8 percent slopes	All areas are prime farmland
3503	Uhlig ashy silt loam, dry, 0 to 8 percent slopes	All areas are prime farmland
3504	Brincken ashy silt loam, 0 to 8 percent slopes	All areas are prime farmland
4000	Hunters ashy silt loam, 0 to 8 percent slopes	All areas are prime farmland
4031	Lakespring ashy loam, 0 to 8 percent slopes	All areas are prime farmland
4041	Wolfeson ashy very fine sandy loam, 0 to 3 percent slopes	All areas are prime farmland
6001	Athena silt loam, 0 to 8 percent slopes	All areas are prime farmland
6040	Larkin silt loam, 0 to 8 percent slopes	All areas are prime farmland
6043	Larkin-Driscoll complex, 0 to 8 percent slopes	All areas are prime farmland
6061	Naff silt loam, 0 to 8 percent slopes	All areas are prime farmland
6093	Reardan silt loam, 0 to 8 percent slopes	All areas are prime farmland
6140	Driscoll silt loam, 0 to 8 percent slopes	All areas are prime farmland
8002	Saltese muck, drained, 0 to 3 percent slopes	All areas are prime farmland
9300	Taney ashy silt loam, 3 to 8 percent slopes	All areas are prime farmland
9336	Carlinton, dry,-Taney complex, 3 to 8 percent slopes	All areas are prime farmland
9350	Southwick ashy silt loam, 3 to 8 percent slopes	All areas are prime farmland
1030	Emdent ashy silt loam, 0 to 3 percent slopes	Farmland of statewide importance
2040	Klickson gravelly ashy silt loam, mass wasted, 15 to 30 percent slopes	Farmland of statewide importance
2081	Gibbs ashy silt loam, 8 to 15 percent slopes	Farmland of statewide importance
3025	Bong ashy sandy loam, moist, 15 to 30 percent slopes	Farmland of statewide importance
3031	Bonner-Wapal complex, 8 to 15 percent slopes	Farmland of statewide importance
